Introduction

General Description

McQuay Air-Cooled Global Water Chillers are complete, self-contained automatic refrigerating units. Every unit is completely assembled, factory wired, charged, and tested. Each unit consists of twin air-cooled condensers with integral subcooler sections, two tandem or triple scroll compressors, brazed-plate or replaceable tube, dual circuit shell-and-tube evaporator, and complete refrigerant piping. Liquid line components include manual liquid line shutoff valves, sight-glass/moisture indicators, solenoid valves, and thermal expansion valves. Other features include compressor crankcase heaters, an evaporator heater for chilled water freeze protection, limited pumpdown during "on" or "off" periods, automatic compressor lead-lag to alternate the compressor starting sequence, and sequenced starting of compressors.

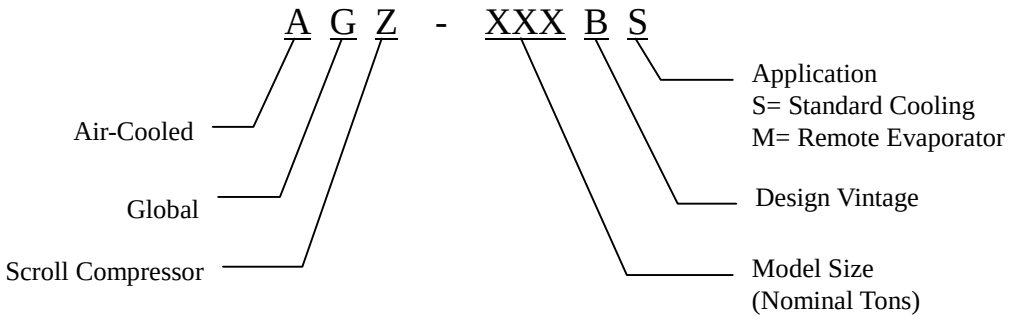
The electrical control center includes all equipment protection and operating controls necessary for dependable automatic operation. Condenser fan motors are protected in all three phases and started by their own three-pole contactors.

Inspection

Check all items carefully against the bill of lading. Inspect all units for damage upon arrival. Report shipping damage and file a claim with the carrier. Check the unit nameplate before unloading, making certain it agrees with the power supply available. McQuay is not responsible for physical damage after the unit leaves the factory.

Note: Unit shipping and operating weights are available in the Physical Data tables beginning on page 28.

Nomenclature



Installation

Note: Installation is to be performed by qualified personnel who are familiar with local codes and regulations.

WARNING
Sharp edges on unit and coil surfaces are a potential hazard to personal safety. Avoid contact with them.

Handling

Be careful to avoid rough handling of the unit. Do not push or pull the unit from anything other than the base. Block the pushing vehicle away from the unit to prevent damage to the sheet metal cabinet and end frame (see Figure 1).

To lift the unit, 2 1/2" (64mm) diameter lifting tabs are provided on the base of the unit. Arrange spreader bars and cables to prevent damage to the condenser coils or cabinet (see Figure 2).

Figure 1, Suggested Pushing Arrangement

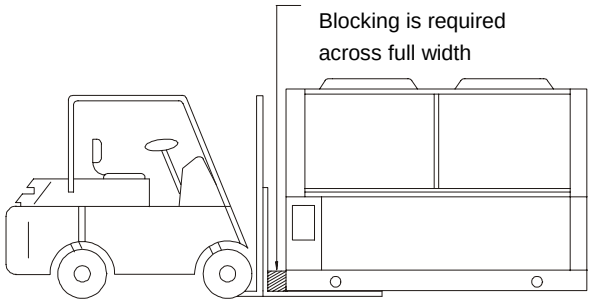


Figure 2, Suggested Lifting Arrangement

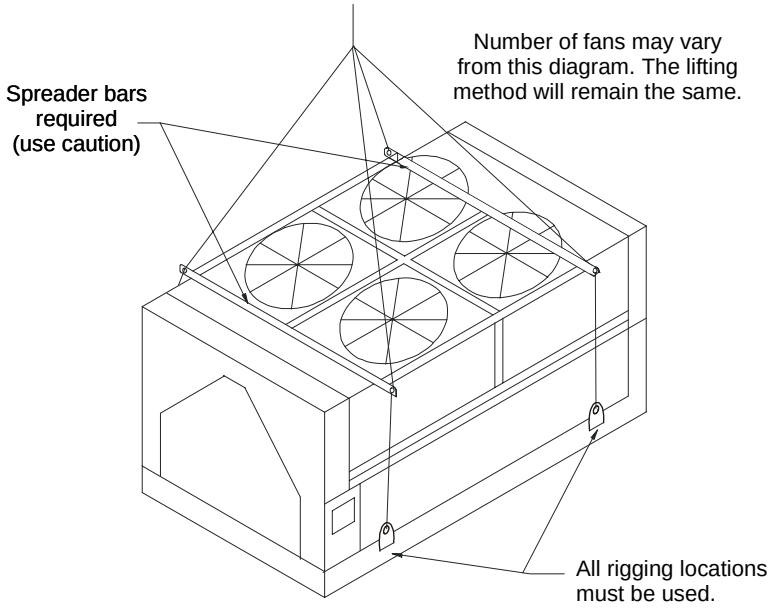

Location

Unit Placement

AGZ units are for outdoor applications and can be mounted either on a roof or at ground level. For roof mounted applications, install the unit on a steel channel or I-beam frame to support the unit above the roof. For ground level applications, install the unit on a substantial base that will not settle. A one-piece concrete slab with footings extended below the frost line is recommended. Be sure the foundation is level within 1/2" (13mm) over its length and width. The foundation must be strong enough to support the weights listed in the Physical Data Tables beginning on page 28.

Figure 3, Clearances

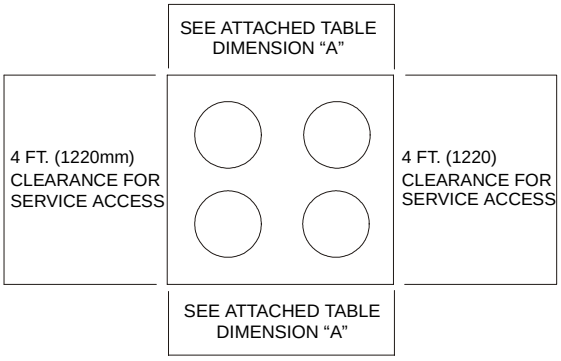

Table 1, Recommended Minimum Clearances

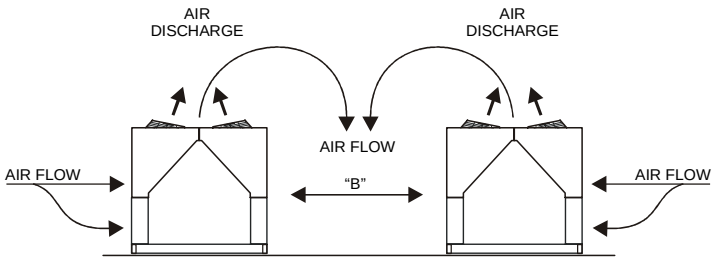
Model Size	Coil Side "A" ft (m)	"B" ft (m)	"C" ft (m)	End Opposite Controls ft (m)	Control Panel End ft. (m)
026B – 070B	4 (1.2)	8 (2.4)	6 (1.8)	4 (1.2)	4 (1.2)
075B – 130B	6 (1.8)	12 (3.6)	8 (2.4)	4 (1.2)	4 (1.2)

Clearances

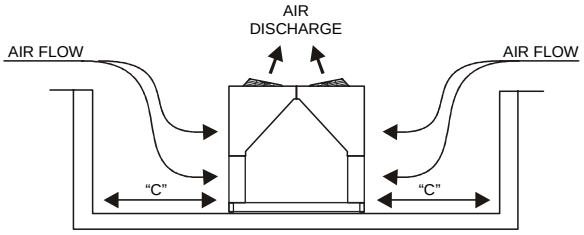
Do not block the flow of air to and from the condenser coil. Restricting airflow or allowing air recirculation will result in a decrease in unit performance and efficiency because discharge pressures are increased. There must be no obstruction above the unit that would deflect discharge air downward where it could be recirculated back to the inlet of the condenser coil. The condenser fans are propeller type and will not operate with ductwork.

Install the unit with enough side clearance for air to enter the coil and for servicing. Provide service access to the evaporator, compressors, electrical control panel and piping components.

Do not allow debris to accumulate near the unit where it could be drawn into the condenser coil. Keep condenser coils and fan discharge free of snow or other obstructions to permit adequate airflow for proper operation.



The recommended minimum side clearance between two units is dimension "B' in table on this page.



The unit must not be installed in a pit or enclosure that is deeper or taller than the height of the unit unless extra space is provided. The minimum clearance on each side of the unit is dimension "C" in table on this page.

Restricted Air Flow

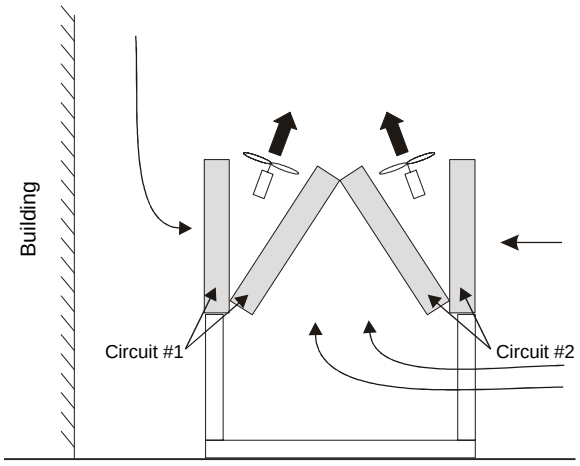
General

The clearances required for design-life operation of AGZ air-cooled condensers are described in the previous section. Occasionally, these clearances cannot be maintained due to site restrictions such as units being too close together or a fence or wall restricting airflow, or both.

Fortunately, the McQuay AGZ chillers have several features that can mitigate the problems attributable to restricted airflow.

- The condenser section is shaped as shown Figure 4. This allows inlet air for these coils to come in from either side. A vertical coil and its adjacent angled coil are manifolded together to serve one refrigerant circuit.
- The MicroTech II™ control is proactive in response to "off-design conditions". In the case of single or compounded influences restricting airflow to the unit, the microprocessor will act to keep the compressor(s) running (possibly at reduced capacity) rather than allowing a shut-off on high discharge pressure.
- The MicroTech II™ control can be programmed to sequence the compressors in the most advantageous way. For example, in the diagram shown below, it might be desirable to program circuit #1 to be the lag circuit (last circuit to reach full load) during periods of high ambient temperatures.

Figure 4, Coil and Fan Arrangement



NOTE: Models AGZ 026 to 035 do not have an interior slanted coil.

The following sections discuss the most common situations of condenser air restriction and give capacity and power adjustment factors for each. Note that in unusually severe conditions, the MicroTech II™ controller would adjust the unit operation to remain online until a less severe condition is reached.

Case 1, Building or Wall on One Side of One Unit

The existence of a screening wall or the wall of a building in close proximity to an air-cooled chiller is common in both rooftop and ground level applications. Hot air recirculation on the coils adjoining the wall will increase compressor discharge pressure, decreasing capacity and increasing power consumption. Only the compressor(s) connected to these coils will be affected. Circuits opposite the wall are unaffected.

When close to a wall, it is desirable to place chillers on the north or east side of them. It is also desirable to have prevailing winds blowing parallel to the unit's long axis. The worst case is to have wind blowing hot discharge air into the wall.

Figure 5, Unit Adjacent to Wall

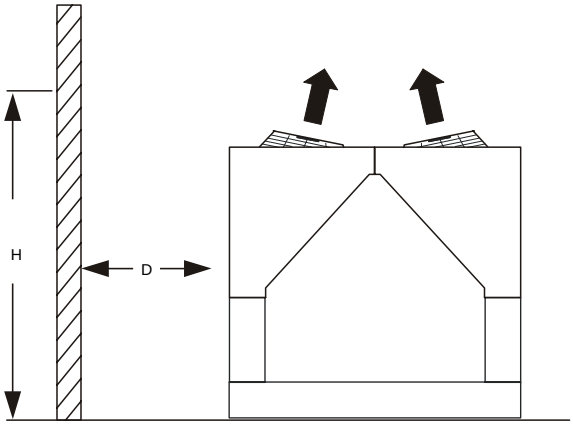


Figure 6, Adjustment Factors

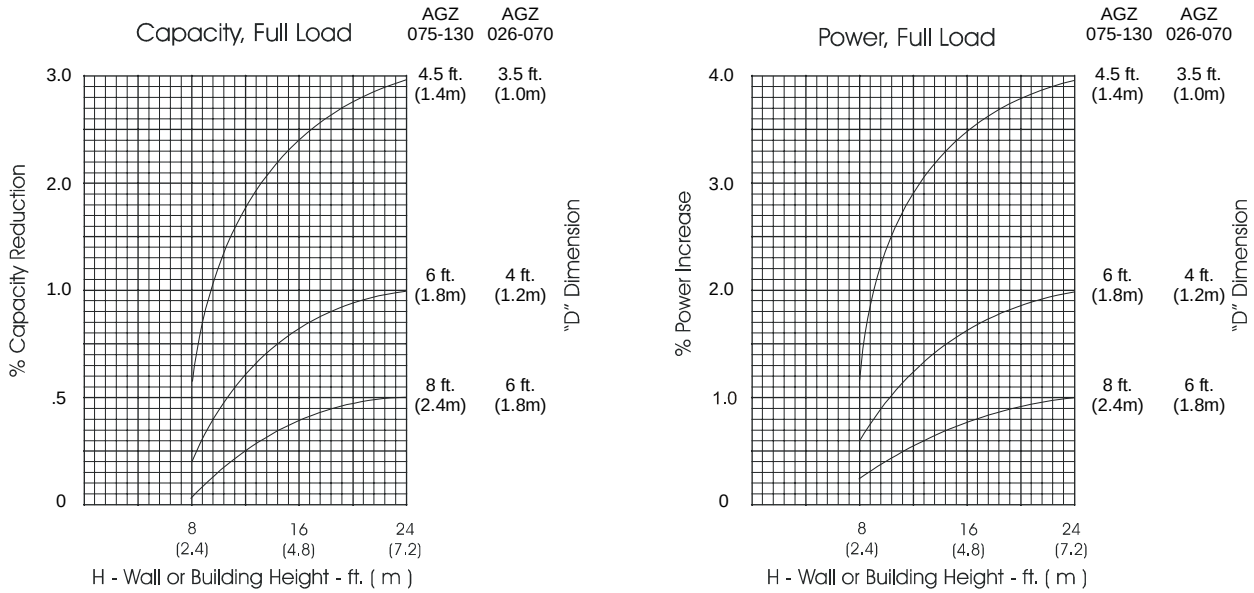

Case 2, Two Units Side By Side

Two or more units sited side by side are common. If spaced closer than 12 feet (3.7 meters) or 8 feet (2.5meters) depending on size, it is necessary to adjust the performance of each unit; circuits adjoining each other are affected. **NOTE:** This case applies only to *two* units side by side. See Case 3 for three or more parallel units. If one of the two units also has a wall adjoining it, see Case 1. Add the two adjustment factors together and apply to the unit located between the wall and the other unit.

Mounting units end to end will not necessitate adjusting performance. Depending on the actual arrangement, sufficient space must be left between the units for access to the control panel door opening and/or evaporator tube removal. See "Clearance" section of this guide for requirements for specific units.

Figure 7, Two Units Side by Side

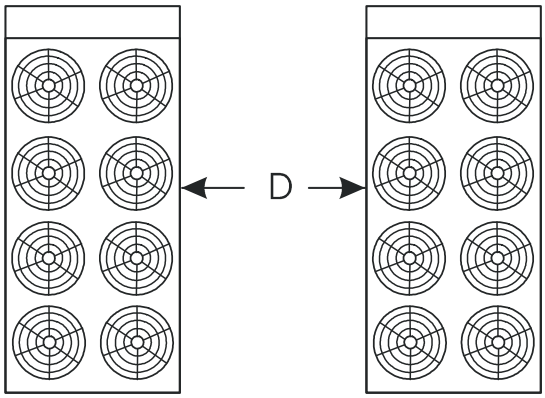

Figure 8, Adjustment Factor

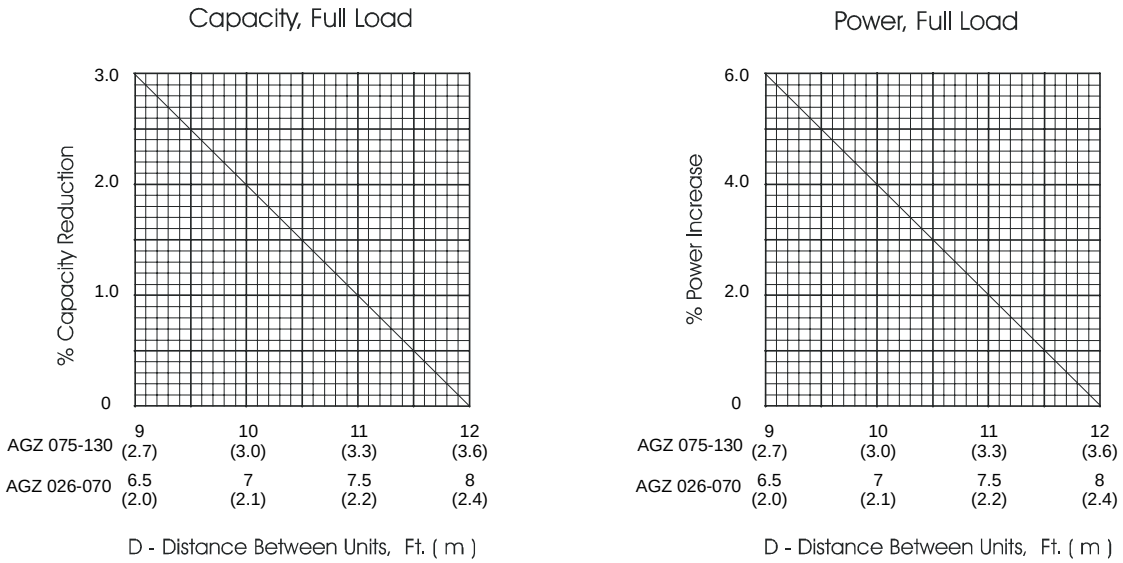

Case 3, Three or More Units Side By Side

When three or more units are side by side, the outside chillers (1 and 3 in this case) are influenced by the middle unit only on their inside circuits. Their adjustment factors will be the same as Case 2. All inside units (only number 2 in this case) are influenced on both sides and must be adjusted by the factors shown below.

Figure 9, Three or More Units

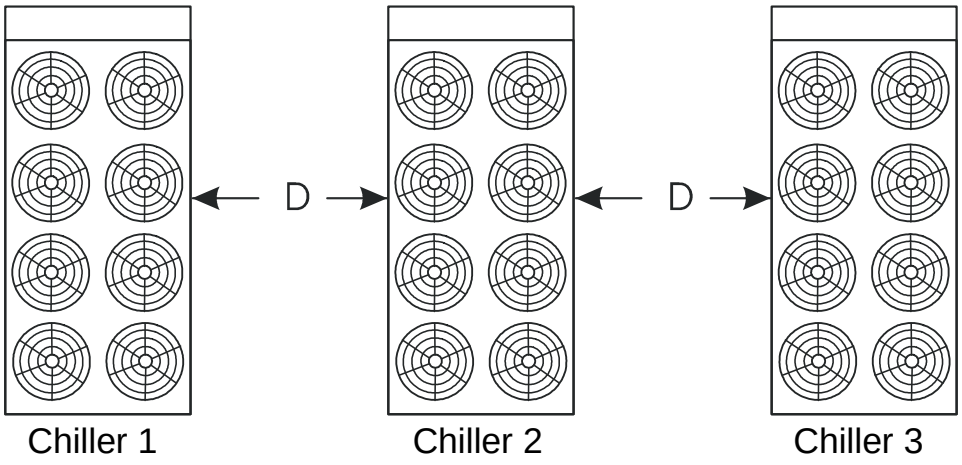

Figure 10, Adjustment Factor

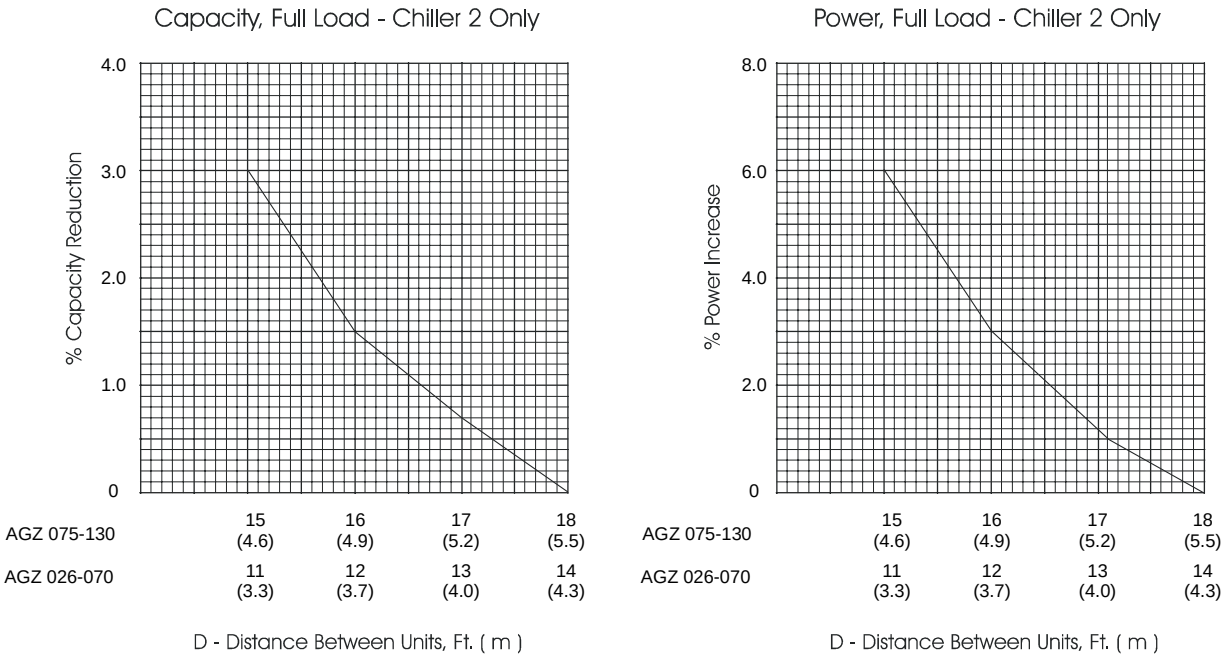

Case 4, Open Screening Walls

Decorative screening walls are often used to help conceal a unit either on grade or on a rooftop. These walls should be designed such that the combination of their open area and distance from the unit do not require performance adjustment. It is assumed that the wall height is equal to or less than the unit height when mounted on its base support. This is usually satisfactory for concealment. If the wall height is greater than the unit height, see Case 5, Pit Installation.

The distance from the ends of the unit to the end walls should be sufficient for service, opening control panel doors, and pulling evaporator tubes, as applicable.

If each side wall is a different distance from the unit, the distances can be averaged providing either wall is not less than 8 feet (2.4 meters) from the unit. For example, do not average 4 feet and 20 feet to equal 12 feet.

Figure 11, Open Screening Walls

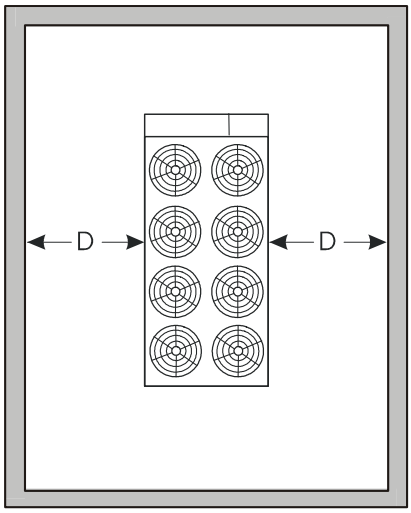

Figure 12, Wall Free Area vs Distance

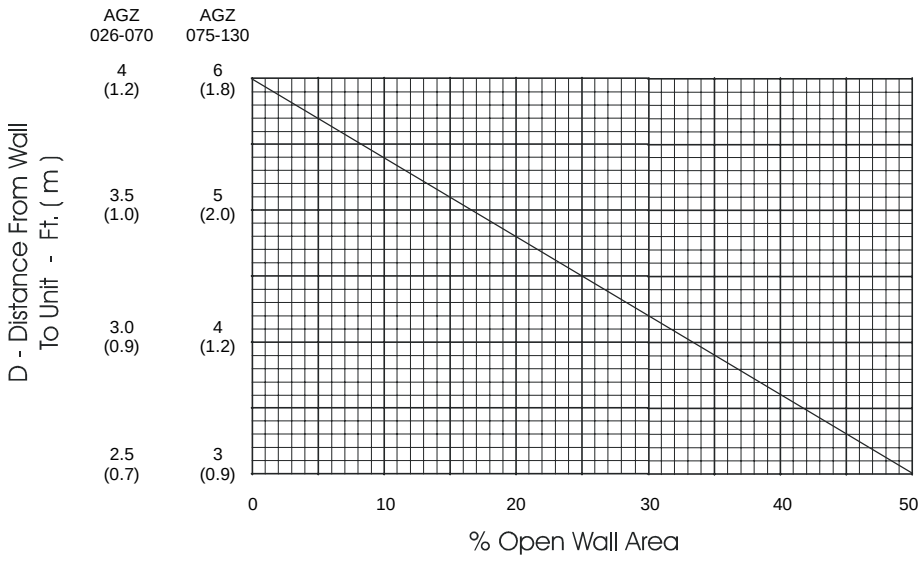

Case 5, Pit/Solid Wall Installation

Pit installations can cause operating problems and great care should be exercised if they are to be used on an installation. Recirculation and restriction can both occur. A solid wall surrounding a unit is substantially the same as a pit and the data presented here should be used.

Steel grating is sometimes used to cover a pit to prevent accidental falls or trips into the pit. The grating material and installation design must be strong enough to prevent such accidents, yet provide abundant open area or serious recirculation problems will occur. Have any pit installation reviewed by McQuay application engineers prior to installation to make sure it has sufficient air-flow characteristics. The installation design engineer must approve the work to avoid the risk of accident.

Figure 13, Pit Installation

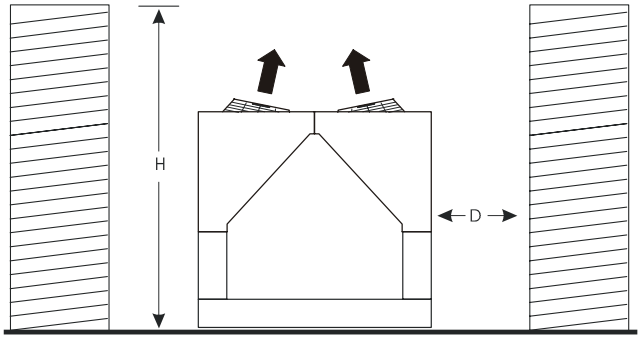

Figure 14, Adjustment Factor

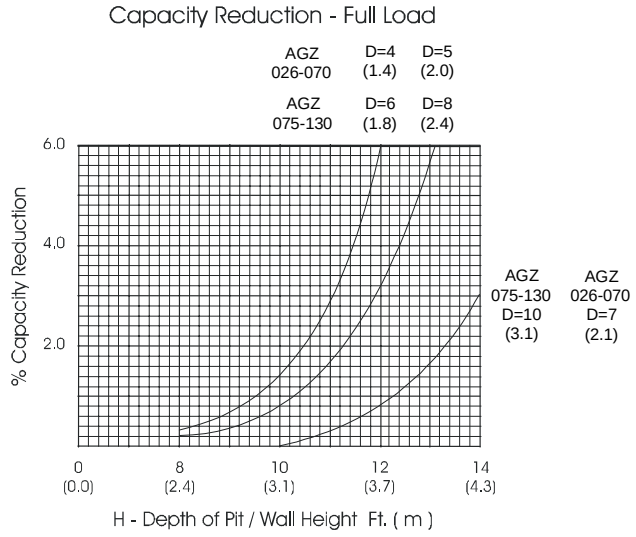
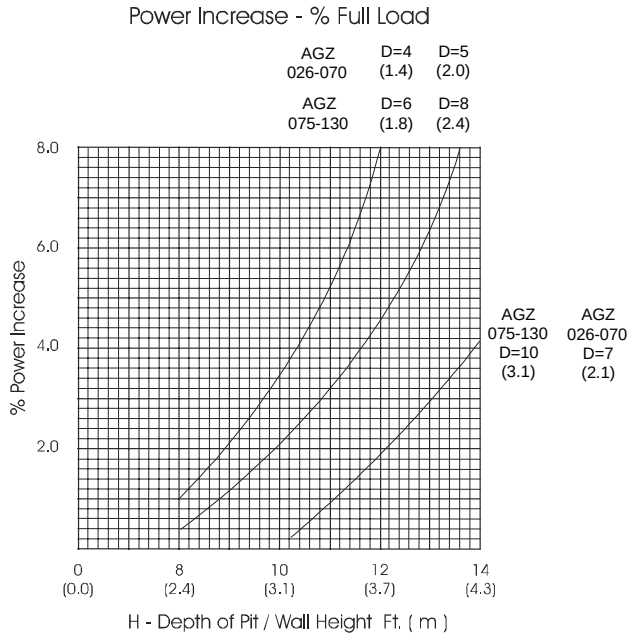




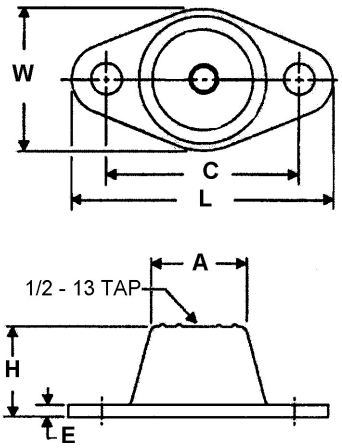
Sound Isolation

The low sound level of the AGZ chiller is suitable for most applications. When additional sound reduction is necessary, locate the unit away from sound sensitive areas. Avoid locations beneath windows or between structures where normal operating sounds may be objectionable. Reduce structurally transmitted sound by isolating water lines, electrical conduit and the unit itself. Use wall sleeves and rubber isolated piping hangers to reduce transmission of water or pump noise into occupied spaces. Use flexible electrical conduit to isolate sound transmission through electrical conduit. Spring isolators are effective in reducing the low amplitude sound generated by scroll compressors and for unit isolation in sound sensitive areas.

Vibration Isolators

Vibration isolators are recommended for all roof mounted installations or wherever vibration transmission is a consideration. Table 2 lists isolator loads for all unit sizes.

Neoprene-in-Shear Dimensions



Color Code	L	W	H	B	C	D
Gray	5.5	3.37	1.75	0.5	4.12	0.56
Black, Red	6.25	4.62	1.62	0.5	5.0	0.56

Spring Isolator Dimensions

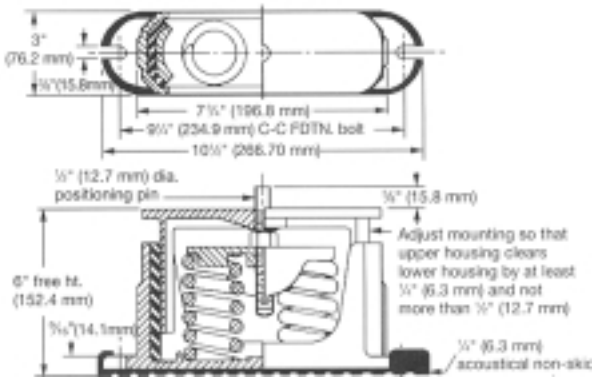


Figure 15 shows isolator locations. See Dimensional Data starting on page 51 for detailed mounting hole locations.

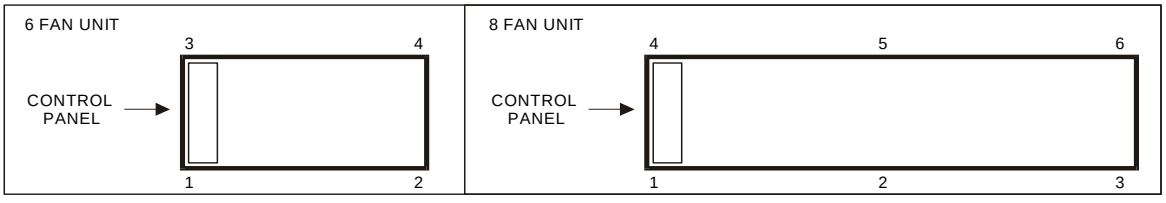
Isolators are also recommended for slab installations, primarily to keep the unit base from resting its entire length directly on the slab.

Isolator Installation

The unit should be initially installed on shims or blocks at the listed free height. When all piping, wiring, flushing, charging, etc. is completed, adjust the springs upward to load them and to provide clearance to remove the shims or blocks.

Installation of spring isolators requires flexible piping connections and at least three feet of conduit flex tie-ins. Piping and conduit must be supported independently of the unit.

Figure 15, Isolator Locations



NOTE: 4-fan units are same as 6-fan units. See Table 2 for number of fans and mounting location weights.

Table 2, AGZ-BS, Isolator Loads At Each Mounting Location (With Aluminum Fins)

Ambient and Water Flow Limitations

AGZ units are designed to operate in temperatures as show in the following table.

Table 5, Unit Maximum Operating Ambient Temperature

AGZ Unit Model	Standard Controls	w/ Low Ambient VFD Control Option	w/ or w/o Low Ambient VFD Control Plus High Ambient Panel Option
AGZ 026B – 130B	115°F	105°F	125°F

The VFD Low Ambient Control Option on models AGZ 026B to 130B imposes an additional heat load on the control panel limiting operation to 105°F ambient temperature. The addition of the High Ambient Panel Option allows operation to 125°F ambient temperature.

Compressor loading and unloading is adaptively determined by system load, ambient air temperature, and other inputs to the MicroTech II control algorithms. A low ambient fan VFD option allows operation down to 0°F (-18°C). The minimum ambient temperature is based on still conditions where the wind is not greater than five mph. Greater wind velocities will result in reduced discharge pressure, increasing the minimum operating ambient temperature. Field installed hail/wind guards are available to allow the chiller to operate effectively down to the ambient temperature for which it was designed.

Evaporator flow rates below the minimum values can result in laminar flow causing freeze-up problems, scaling and poor control. Flow rates above the maximum values will result in unacceptable pressure drops and can cause excessive erosion, potentially leading to failure.

Water Piping

Local authorities can supply the installer with the proper building and safety codes required for safe and proper installation.

Install piping with minimum bends and changes in elevation to minimize pressure drop. The following issues must be considered when designing and installing water piping:

1. Vibration eliminators to reduce vibration and noise transmission to the building.
2. Shutoff valves are required to isolate the unit from the piping during unit servicing.
3. Manual or automatic air vent valves at the high points of the system. Drains must be installed at the lowest points in the system.
4. Adequate water pressure must be maintained (expansion tank or regulating valve).
5. Temperature and pressure indicators located at the unit are required to aid in unit servicing.
6. A strainer or other means of removing foreign matter from the water before it enters the pump must be installed. Place the strainer far enough upstream to prevent cavitation at the pump inlet (consult pump manufacturer for recommendations). The use of a strainer will prolong pump life and keep system performance up.
7. A strainer must be installed in the water line before the inlet of the evaporator. This will help prevent foreign material from entering and decreasing the evaporator performance.
8. The unit's evaporator has a thermostat and heater to prevent freeze-up down to -20°F (-29°C). The heating cable can be wired to a separate 115V supply circuit. As shipped from the factory, the heating cable is wired to the control circuit. All water piping to the unit must also be protected to prevent freezing.

CAUTION

If separate disconnect is used for the 115V supply to the evaporator heating cable, mark the disconnect clearly to ensure the disconnect is not accidentally shut off during cold seasons causing a possible damaging evaporator freeze-up.

9. If the unit is used as a replacement chiller, flush the system thoroughly before unit installation. Regular water analysis and chemical water treatment for the evaporator loop is recommended immediately at equipment start-up.
10. The total water volume in the system should be sufficient to prevent frequent "on-off" cycling. Turnover rate should not be less than 4 minutes for normal variable cooling loads.
11. When glycol is added to the water system for freeze protection, the refrigerant suction pressure will be lower, cooling performance less, and water side pressure drop greater. If the percentage of glycol is high, or if propylene is used instead of ethylene glycol, the added pressure drop and loss of performance could be substantial. When Glycol or Ice are selected as Unit Mode, the MicroTech II will automatically reset the available range for the Leaving Water Temperature, Freezestat and Evaporator Pressure settings.
12. Reset the freezestat setting to approximately 4 to 5 degrees F (2.3 to 2.8 degrees C) below the leaving chilled water setpoint temperature. See the section titled "Glycol Solutions" for additional information concerning glycol.
13. Perform a preliminary leak check before insulating the piping and filling the system.
14. Piping insulation should include a vapor barrier to prevent condensation and possible damage to the building structure.

Figure 16, AGZ 075 – AGZ 130, Typical Field Evaporator Water Piping

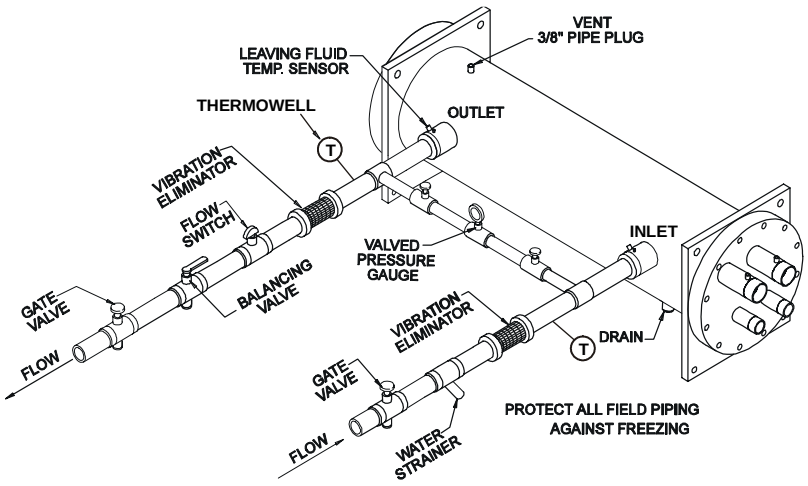

Figure 17, AGZ 026 - AGZ 070, Typical Field Evaporator Water Piping

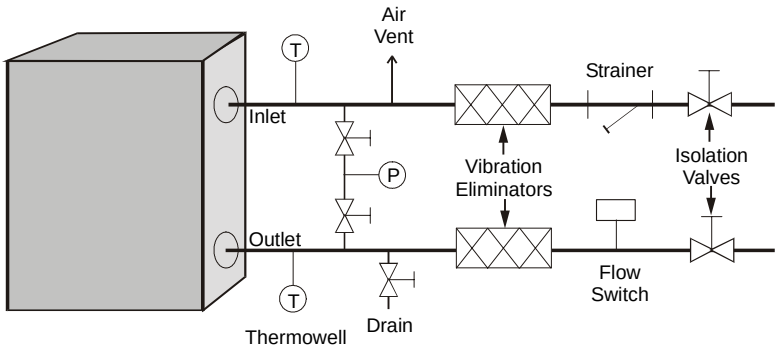


NOTE: Outdoor piping must be protected if freezing temperatures are a possibility.

Flow Switch

Mount a water flow switch in the leaving water line to shut down the unit when water flow is interrupted. A flow switch is an equipment protection control and should never be used to cycle a unit.

A "paddle" type flow switch is available from McQuay (part number 017503300). Certain minimum flow rates are required to close the switch and are listed in Table 6.

Installation should be as shown in Figure 18. Connect the normally open contacts of the flow switch in the unit control center at terminals 44 and 61. There is also a set of normally closed contacts on the switch that can be used for an indicator light or an alarm to indicate when a "no flow" condition exists. Freeze protect any flow switch that is installed outdoors. Manufacturer's instructions included with the switch should be followed.

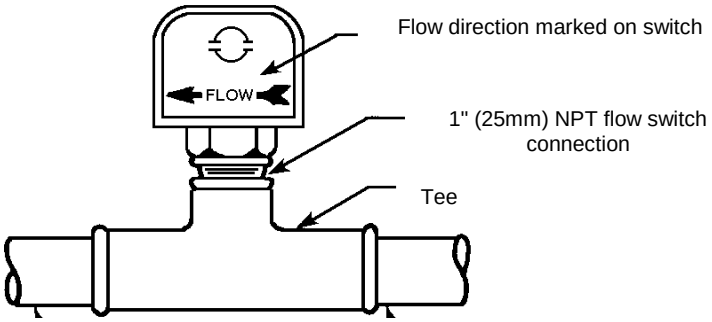
NOTE: Differential pressure switches are not recommended for outdoor installation. They can freeze and not indicate a no-flow condition.

Table 6, Flow Switch Minimum/Maximum Flow Rates

Nominal Pipe Size Inches (mm)	Minimum Required Flow To Activate Switch - gpm (l/m)	Maximum Safe Flow Rate gpm (l/m)
2 (50.8)	13.7 (51.8)	105 (397.4)
2 1/2 (63.50	17.9 (67.8)	149 (564.0)
3 (76.20	24.2 (91.6)	230 (870.6)
4 (101.6)	35.3 (134.0)	397 (1502.7)
5 (127.0)	48.6 (184.0)	654 (2475.4)
6 (152.4)	60.3 (228.0)	900 (3406.5)

Note: See pressure drop table on page 18 for minimum and maximum flow through the evaporator.

Figure 18, Flow Switch Installation



Water Connections

Bring water piping to the evaporator through the side between the vertical supports. Provide taps for the connection of pressure gauges and thermometers in the inlet and outlet lines. Check the inlet and outlet labels on the unit against the certified drawings supplied on the job and be sure the water piping is hooked up correctly. Contact the McQuay sales office if any discrepancies exist.

System Water Volume Considerations

All chillers need adequate time to recognize a load change, respond to the change and stabilize without short cycling the compressor. The water volume in the system and the size of the piping loop is a critical consideration. Good engineering practice is to have a minimum water volume of four times the flow rate (GPM) for comfort cooling applications. For process applications where the load can change quickly, contact the local McQuay sales office for recommendations. A water storage tank (provided by others) may be required to increase the system water volume in some systems.

Since there are many other factors that can influence performance, systems can successfully operate below these suggestions. However, as the water volume decreases below these suggestions, the possibility of problems increases. We believe that these guidelines should be an industry standard and not just recommendations from McQuay.

Variable Speed Pumping

Variable water flow involves reducing the water flow through the evaporator as the load decreases. McQuay chillers are designed for this duty provided that the rate of change in water flow is not greater than 10 percent of the change per minute.

The water flow through the vessel must remain between the minimum and maximum values listed on page 22. If flow drops below the minimum allowable, large reductions in heat transfer can occur. If the flow exceeds the maximum rate, excessive pressure drop and tube erosion can occur.

Glycol Solutions

The use of a glycol/water mixture in the evaporator to prevent freezing will reduce system capacity and efficiency, as well as increase pressure drop. The system capacity, required glycol solution flow rate, and pressure drop with glycol may be calculated using the following formulas and tables.

1. **Capacity** – Multiply the capacity based on water by the *Capacity* correction factor from Table 7 through Table 10.

2. **Flow** – Multiply the water evaporator flow by the *Flow* correction factor from Table 7 through Table 10 to determine the increased evaporator flow due to glycol.

   If the flow is unknown, it can be calculated from the following equation:

   $$\text{Glycol Flow (gpm)} = \frac{24 \times Tons\ Capacity\ (glycol)}{Delta - T} \times Flow\ Correction\ Factor)$$

   For Metric Applications – Use the following equation for metric applications:

   $$\text{Glycol Flow (l/s)} = \frac{kW\ Capacity}{4.18 \times Delta - T} \times Flow\ Correction\ Factor$$

3. **Pressure drop** -- Multiply the water pressure drop from page 22 by *Pressure Drop* correction factor from Table 7 through Table 10. High concentrations of propylene glycol at low temperatures may cause unacceptably high pressure drops.
4. **Power** -- Multiply the water system power by *Power* correction factor from Table 7 through Table 10.

Test coolant with a clean, accurate glycol solution hydrometer (similar to that found in service stations) to determine the freezing point. Obtain percent glycol from the freezing point table below. It is recommended that a minimum of 25% solution by weight be used for protection against corrosion or that additional compatible inhibitors be added.

Concentrations above 35 percent do not provide any additional burst protection and should be carefully considered before using.

CAUTION

Do not use an automotive grade antifreeze. Industrial grade glycols must be used. Automotive antifreeze contains inhibitors which will cause plating on the copper tubes within the chiller evaporator. The type and handling of glycol used must be consistent with local codes.

Altitude Correction Factors

Performance tables are based at sea level. Elevations other than sea level affect the performance of the unit. The decreased air density will reduce condenser capacity consequently reducing the unit's performance. For performance at elevations other than sea level, refer to Table 11 or Table 12.

Evaporator Temperature Drop Factors

Performance tables are based on a 10°F (5°C) temperature drop through the evaporator. Adjustment factors for applications with temperature ranges from 6°F to 16°F (3.3°C to 8.9°C) are in Table 11 or Table 12.

Temperature drops outside this 6°F to 16°F (3.3°C to 8.9°C) range can affect the control system's capability to maintain acceptable control and are not recommended.

The maximum water temperature that can be circulated through the evaporator in a non-operating mode is 100°F (37.8°C).

Fouling Factor

Performance tables are based on water with a fouling factor of

$0.0001\,ft^2 \times hr \times °F / BTU$ *or* $(0.0176 m^2 \times °C / kW)$ per ARI 550/590-98.

As fouling is increased, performance decreases. For performance at other than 0.0001 (0.0176) fouling factor, refer to Table 11 or Table 12.

Foreign matter in the chilled water system will adversely affect the heat transfer capability of the evaporator and could increase the pressure drop and reduce the water flow. Maintain proper water treatment to provide optimum unit operation.

Evaporator Freeze Protection

Evaporator freeze-up can be a concern in the application of air-cooled water chillers. To protect against freeze-up, insulation and an electric heater cable are furnished with the unit. This protects the evaporator down to -20°F (-29°C) ambient air temperature. Although the evaporator is equipped with freeze protection, it does not protect water piping external to the unit or the evaporator itself if there is a power failure or heater cable burnout. Consider the following recommendations for additional protection.

1. If the unit will not be operated during the winter, drain evaporator and chilled water piping and flush with glycol. Drain and vent connections are provided on the evaporator to ease draining.
2. Add a glycol solution to the chilled water system to provide freeze protection. Freeze point should be approximately ten degrees below minimum design ambient temperature.
3. The addition of thermostatically controlled heat and insulation to exposed piping.
4. Continuous circulation of water through the chilled water piping and evaporator.

The evaporator heater cable is factory wired to the 115-volt circuit in the control box. This power should be supplied from a separate source, but it can be supplied from the control circuit. Operation of the heater cable is automatic through the ambient sensing thermostat that energizes the evaporator heater cable for protection against freeze-up. Unless the evaporator is drained in the winter, the disconnect switch to the evaporator heater must not be open.

Evaporator Flow and Pressure Drop

Evaporator flow rate must fall between the minimum and maximum values shown in the evaporator pressure drop table on the following page.

Figure 19, AGZ 026B – 130B, Evaporator Pressure Drop

NOTE: Minimum and maximum flows are established to ensure the Delta-T for each unit size falls within the 6 - 16°F range for proper unit control.

Wind Baffles and Hail Guards

Wind Baffles/Hail Guards are a field installed option that are used to stabilize unit operation in high wind areas and to assist in operation at low ambient temperatures. Figure 20 is a sketch of a typical panel assembly on an AGZ unit. The actual number of panels and parts will vary by model size. The parts are shown in the table below and referenced by balloon numbers.

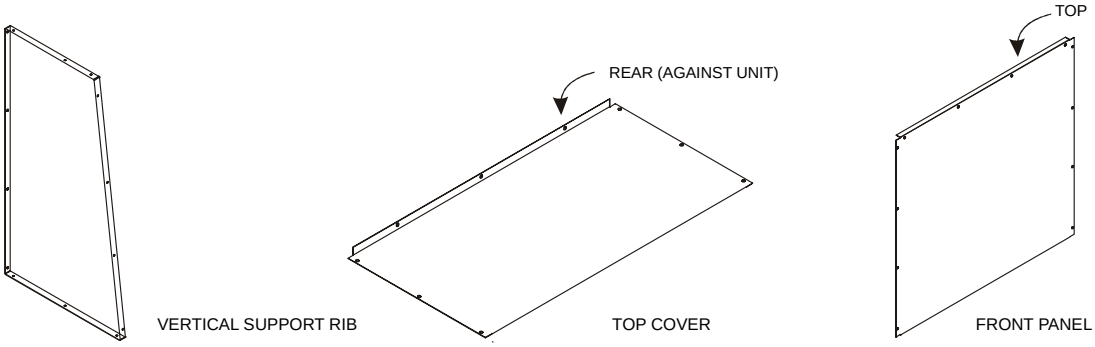
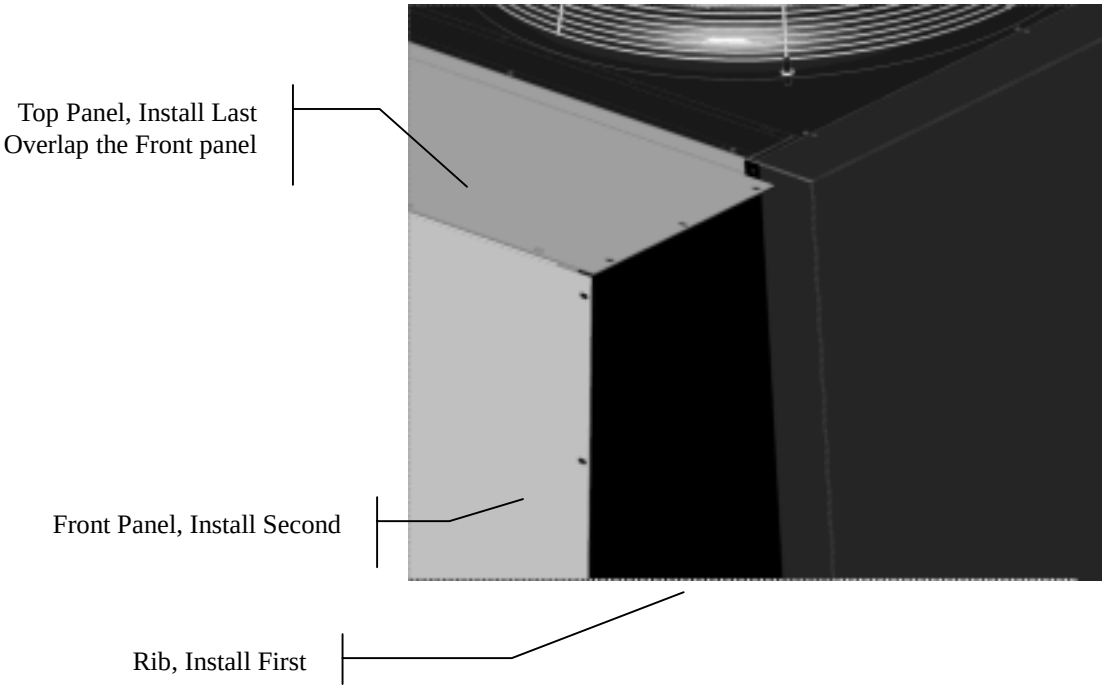
Figure 21, Components





Optional Features

Controls

Hot Gas Bypass

Hot gas bypass permits unit operation down to 10% of full load capacity. This option includes a factory-mounted hot gas bypass valve, solenoid valve, and manual shutoff valve for each circuit. See page 93 for further information.

Head Pressure Control

Optional fan VFD control allows unit operation down to 0°F (-18°C). (Not available on 380 volt, 60 Hertz units.)

Water Flow Switch

(P/N 017503300) A water flow switch is available for field installation in the chilled water piping to avoid evaporator freeze-up under low or no flow conditions. Terminals are provided in the unit control center for field hook-up of the water flow switch. If this option is not ordered with the unit, then a field supplied water flow switch must be installed.

Alarm Bell

Bell for field installation and wiring to the control panel to provide remote indication of unit alarm condition. See Field Wiring Diagram for connection locations.

BAS Interface (Protocol Selectability™)

Connection to Chiller

Connection to the chiller for all building automation systems (BAS) protocols will be at the unit controller. An interface card, depending on the protocol being used, may have been factory-installed in the unit controller (or it can be field installed).

Protocols Supported

Table 14, Standard Protocol Data

Protocol	Physical Layer	Data Rate	Controller	Other
BACnet®/IP or BACnet/Ethernet	Ethernet 10 Base-T	10 Megabits/sec	MicroTech II	Reference ED 15062
BACnet MSTP	RS-485	9600, 19200 or 38400 bits/sec	MicroTech II	Reference ED 15062
LONWORKS®	FTT-10A	78kbits/sec	MicroTech II	Reference ED 15062
Modbus RTU	RS-485 or RS-232	9600 or 19200 bits/sec	MicroTech II	Reference ED 15063

The interface kits on the MicroTech II controller are as follows:

- BACnet Kit P/N 350147404: BACnet/IP, BACnet MS/TP, or BACnet Ethernet
- LONWORKS Kit P/N 350147401: LonTalk (FTT-10A)
- Modbus: Modbus RTU

The following functions are available through the BAS where possible. Exact capabilities may vary depending on the protocol in use.

- Enable/Disable chiller operation by setting the Unit Enable setpoint.
- Select the operating mode by setting the Unit Mode setpoint.
- Set the Cool LWT and Ice LWT setpoints.
- Set the Network Limit variable.
- Read Enable/Disable status of chiller
- Read current operating mode and status (state) of chiller.
- Read a description of each alarm when it occurs.

Reference documents ED 15062 and ED 15063 may be obtained from the local McQuay sales office, from the local McQuayService office, or from the McQuay Technical Response Center, located in Staunton, Virginia (540-248-0711).

These documents can also be found on www.mcquay.com under Product Information > (chiller type) > Control Integration.

Unit

Vibration Isolators

Spring vibration isolators are available for field installation to reduce vibration transmission through the unit base. See page 12 for detailed information on their installation.

Protective Base Guards

Optional factory-installed, vinyl-coated welded wire base guards provide all-around lower unit protection on ground level installations. Coil guards are standard.

Copper Fin Condenser Coils

Copper fin condenser coils are available as an option on all models.

Black Fin Coils

Aluminum fin stock precoated with a phenolic coating with 1000 hour salt spray resistance (ASTM B117-90).

Coated Fins

Copper or aluminum fins coated with *ElectroFin*® baked epoxy protective coating with 3000+ hour salt spray resistance (ASTM B117-90).

Evaporator Insulation

Double insulation thickness (total of 1½ inches) for high humidity areas or low fluid temperatures.

Sound Reduction

Acoustical blankets are factory-installed on each compressor.

Hail and Wind Guards

A field-mounted option that is shipped as a kit including panels, fasteners, and instructions. See page 23 for further information.

Shut-off Valves

Factory-mounted suction and discharge shut-off valves, liquid line shutoff valve is standard.

Electrical

Multi-Point Electrical Connection

Provides a power connection to each of the unit's two electrical circuits.

Disconnect Switch with Through-the-Door Handle

A factory or field-installed option for service use, nonfused disconnect switch (mounted inside the power section of the control box) with a through-the-door handle is available with single and multi-point power supply.

Phase Loss/Voltage Protection

Phase loss with under/over voltage protection and multiple LED indication of fault type is available as a factory-installed option to guard against compressor motor burnout.

Convenience Outlet

10.0 amp, 115-volt outlet located in control panel to provide power for servicing unit.

Ground Fault Protection

Protects equipment from damage from line-to-ground fault currents less than those required for conductor protection.

High Short Circuit Current Protection

Provides control panel protection against short circuit currents per the following table:

Voltage	208	240	460	600
Current (kA)	120	100	65	25

High Ambient Control Panel

Consists of exhaust fan with rain hood, two inlet screens with filters, necessary controls and wiring to allow operation to 125°F. The option can be factory or field installed as a kit. Must be used for:

- Ambient temperatures above 105°F (40°C) with fan VFD (low ambient option)
- Ambient temperatures above 115°F (46°C) with standard FanTrol control.

NOTES:

1. Units operating in ambient temperatures of 95°F (35°C) and above must use the Maximum Fuse or HACR Breaker size.
2. All Electrical Data notes are on page 49.
3. Conduit hubs are not provided.

NOTES:

1. Units operating in ambient temperatures of 95°F (35°C) and above must use the Maximum Fuse or HACR Breaker size.
2. All Electrical Data notes are on page 49.
3. (2) indicates that two conduits are required.
4. Conduit hubs are not supplied.

NOTES:

1. Units operating in ambient temperatures of 95°F (35°C) and above must use the Maximum Fuse or HACR Breaker size.
2. All Electrical Data notes are on page 49.
3. (2) in column with wire qty. indicates that two conduits are required.
4. Conduit hubs are not supplied.

NOTES:
1. All Electrical Data notes are on page 49.
2. Conduit hubs are not supplied.

Notes for "Electrical Data Single- and Multi-Point" Power:

1. Unit wire size ampacity (MCA) is equal to 125% of the largest compressor-motor RLA plus 100% of RLA of all other loads in the circuit including the control transformer.
2. The control transformer is furnished and no separate 115V power is required. For both single- and multi-point power connections, the control transformer is in circuit #1 with control power wired from there to circuit #2. In multi-point power, disconnecting power to a circuit will disconnect all control power to the unit.
3. If a separate 115V power supply is used for the control circuit, then the wire sizing amps is 10 amps for all unit sizes.
4. Recommended power lead wire sizes for 3 conductors per conduit are based on 100% conductor ampacity in accordance with NEC. Voltage drop has not been included. Therefore, it is recommended that power leads be kept short. All terminal block connections must be made with copper (type THW) wire.
5. "Recommended Fuse Sizes" are selected at approximately 150% to 175% of the largest compressor RLA, plus 100% of all other loads in the circuit.
6. "Maximum Fuse or HACR breaker size" is selected at approximately 225% of the largest compressor RLA, plus 100% of all other loads in the circuit.
7. The recommended power lead wire sizes are based on an ambient temperature of 86°F (30°C). Ampacity correction factors must be applied for other ambient temperatures. Refer to the National Electrical Code Handbook.
8. Must be electrically grounded according to national and local electrical codes.

Voltage Limitations:

Within ± 10 percent of nameplate rating

Notes for "Compressor and Condenser Fan Amp Draw":

1. Compressor RLA values are for wiring sizing purposes only but do not reflect normal operating current draw at rated capacity.

Notes for "Field Wiring Data"

1. Requires a single disconnect to supply electrical power to the unit. This power supply must either be fused or use an HACR type circuit breaker.
2. All field wiring to unit power block or optional non-fused disconnect switch must be copper.
3. All field wire size values given in the tables apply to 75°C rated wire per NEC.

Circuit Breakers

Factory-installed circuit breakers are standard on units with single point power supply only. This option provides unit-installed compressor short circuit protection and makes servicing easier.

Connection Type	Power Block	Disconnect Swt.	Circuit Breakers	High Short Circuit Current
Single Point (Standard)	Std	Opt.	Std	Opt
Multi-Point (Optional)	Std	Opt.	Not Avail.	Opt.

Controller Section Table of Contents

Overview

MicroTech II controller's state-of-the-art design not only permits the chiller to run more efficiently, but also can simplify troubleshooting if a system failure occurs. Every MicroTech II controller is programmed and tested prior to shipment to facilitate start-up.

Operator-friendly

The MicroTech II controller menu structure is separated into three distinct categories that provide the operator or service technician with a full description of 1) current unit status, 2) control parameters, and 3) alarms. Security protection prevents unauthorized changing of the setpoints and control parameters.

MicroTech II control continuously performs self-diagnostic checks, monitoring system temperatures, pressures and protection devices, and will automatically shut down a compressor or the entire unit should a fault occur. The cause of the shutdown will be retained in memory and can be easily displayed in plain English for operator review. The MicroTech II chiller controller will also retain and display the date/time the fault occurred. In addition to displaying alarm diagnostics, the MicroTech II chiller controller also provides the operator with a warning of limit (pre-alarm) conditions.

General Description

AGZ-B Inputs/Outputs

Table 35, Analog Inputs

No.	Description	Type	Signal Source	Range
1	Evaporator Refrigerant Pressure #1	C1	0.1 to 0.9 VDC	0 to 132 psi
2	Evaporator Refrigerant Pressure #2	C2	0.1 to 0.9 VDC	0 to 132 psi
3	Condenser Refrigerant Pressure #1	C1	0.1 to 0.9 VDC	3.6 to 410 psi
4	Leaving Evaporator Water Temperature	UT	NTC Thermister (10k@25°C)	-58 to 212°F
5	Outside Ambient Temperature	UT	NTC Thermister (10k@25°C)	-58 to 212°F
6	Condenser Refrigerant Pressure #2	C2	0.1 to 0.9 VDC	3.6 to 410 psi
7	Reset of Leaving Water Temperature	UT	4-20 mA Current	0-(10 to 80°F)
8	Demand Limit	UT	4-20 mA Current	0-100 % Load
9	Compressor Suction Temperature #1	C1	NTC Thermister (10k@25°C)	-58 to 212°F
10	Compressor Suction Temperature #2	C2	NTC Thermister (10k@25°C)	-58 to 212°F

NOTE: C1 = Refrigerant Circuit #1, C2 = Refrigerant Circuit #2, UT = Unit

Table 36, Analog Outputs

No.	Description	Output Signal	Range
1	Fan #1 VFD	0 to 10 VDC	20 to 60 Hz
2	Fan #2 VFD	0 to 10 VDC	20 to 60 Hz

NOTES:

1. See Safety Alarms Table for “Phase Voltage Protection”. Units with single point electrical connection will have one PVM with Inputs 9 and 10 wired together. Units with multiple point connection will have two PVM’s with Input 9 for Electrical Circuit #1 and Input 10 for Electrical Circuit #2.

2. See Safety Alarms Table 40 for “Ground Fault Protection”. Units with single point electrical connection will have one GFP with Inputs 11 and 12 wired together. Units with multiple point connection will have two GFP’s with Input 11 for Electrical Circuit #1 and Input 12 for Electrical Circuit #2.

Setpoints

The setpoints shown in Table 39 are retained by battery-back-up and remembered during power off, are factory set to the **Default** value, and can be adjusted within the values shown in **Range**.

The PW (password) column indicates the password. Passwords are as follows:
O = Operator =0100
M = Manager=2001

Table 39, Setpoints

Automatic Adjusted Ranges

The following are setpoints that will be limited based on the option selected.

Evaporator Leaving Water Temperature

Mode	Range
Unit Mode = Cool	40 to 60°F
Unit Mode = Cool w/Glycol	20 to 60°F

Evaporator Freeze Temperature

Mode	Range
Unit Mode = Cool	37 to 42°F
Unit Mode = Cool w/Glycol, Ice w/Glycol	18 to 42°F

Low Evaporator Pressure Hold and Unload

Mode	Range
Unit Mode = Cool	55 to 65 Psig
Unit Mode = Cool w/Glycol, Ice w/Glycol	31 to 65 Psig

Low Ambient Lockout Temperature

VFD	Range
VFD = N	35 – 60°F
VFD = Y	-2 – 60°F

Forced Fan 1,2,3

Number of Fans	Range
4	1 – 2 fans
6	1 – 3 fans
8	1 – 4 fans

Shutdown Alarms

Shutdown alarms (also know as “Stop Alarms” or “Safeties”) execute rapid compressor shutdown and require manual reset. They are also logged in the Alarm Log.

The following table identifies each equipment protection alarm, gives the condition that causes the alarm to occur, and states the action taken because of the alarm. If the alarm is auto-clearing, the reset condition is also shown. Otherwise, the alarm is manually reset, requiring the operator to clear the alarm.

Table 40, Shutdown Alarms

Description	Occurs When:	Action Taken	Reset
No Evaporator Water Flow	Evap Pump State = RUN AND Evap Flow Digital Input = No Flow for time > Evap Flow Proof SP	Rapid Stop Unit	Evap flow switch closes
Low Evaporator Pressure	Evaporator Press < Low Evap Pressure SP for time > Low Evap Pressure Delay SP	Rapid Stop Circuit	manual
High Condenser Pressure	Condenser Press > High Condenser Pressure SP	Rapid Stop Circuit	manual
Mechanical High Condenser Pressure/Motor Protect	Digital Input = Off On Power Up: Delay 150 Sec. before checking	Rapid Stop Circuit	manual
Phase Voltage Protection (opt.)	If Phase Voltage Protection = Y, Then Digital Input Off= Phase/Voltage Problem	Rapid Stop Circuit	Phase/Voltage Input returns to normal
Ground Fault Protection (opt.)	If Phase Voltage Protection = Y, Then Digital Input Off= Phase/Voltage Problem	Rapid Stop Circuit	manual
Re-Start Fault	Re-Start = Third Time	Rapid Stop Circuit	manual
Evap. Freeze Protect	Evap LWT < Evaporator Freeze SP AND Unit state = enable	Rapid Stop Unit	manual
Leaving Evap. Water Temp. Sensor Fault	Sensor shorted or open	Normal Stop Unit	manual
Evaporator Pressure Sensor Fault	Sensor shorted or open	Rapid Stop Circuit	manual
Condenser Pressure Sensor Fault	Sensor shorted or open	Rapid Stop Circuit	manual
Outside Ambient Temp. Sensor Fault	Sensor shorted or open	Normal Stop Unit	manual

NOTE: SP=SetPoint

Events (Limit Alarms)

The following events limit the operation of the chiller in some way, as described in the Action Taken column. These events are auto-clearing based on reaching the conditions in the reset column.

Table 41, Limit Alarms

Description	Occurs When:	Action Taken	Reset
Condenser Pressure Stage Down	Pressure > High Condenser Stage Down Setpoint	Shutoff Stage #2	Condenser Press drops below (SP – 100psi)
Low Ambient Lockout	Any compressor is running AND Outside Ambient < Low Amb Lockout SP	Shutoff Stages #1 & #2	Outside Ambient > Low Amb Lockout (SP + 5ºF)
Low Evaporator Pressure – Hold	Pressure < Low Evap Pressure–Hold Setpoint	Hold @ Stage 1	Evap Press rises above (SP + 8psi)
Low Evaporator Pressure – Unload	Pressure < Low Evap Pressure–Unload Setpoint	Shutoff Stage 2	Evap Press rises above (SP + 10 psi)

NOTE: SP = Setpoint

Logging

When an alarm or event occurs, the description, date, and time are stored in the active alarm buffer corresponding to that alarm, viewed on the Alarm Active screens, and also in the alarm history buffer, viewed on the Alarm Log screens. The active alarm buffers hold a record of all current alarms. The active alarms can be cleared by pressing the Enter key when the end of the list has been reached by scrolling. Active alarms may only be cleared if the appropriate password level is active.

A separate alarm log stores the last 25 alarms and events that occur. When an alarm or event occurs, it is put into the first slot in the alarm log, and all others are moved down one, dropping the last entry. The date and time of the occurrence are stored in the alarm log, as well as the unit state. If the alarm is a circuit alarm, then the circuit state, refrigerant pressures and temperatures, and number of fans on are also stored. The parameters may be accessed by scrolling the last line on the alarm log screen (similar to a setpoint).

Control Logic

Unit Enable

Enabling and disabling the chiller is controlled by the Unit Enable Setpoint, with options of OFF and ON. This setpoint can be altered by the Unit Off Input, Digital Input, keypad entry, or BAS request. The Control Source setpoint determines which source can change the Unit Enable setpoint with options of DIGITAL INPUT, KEYPAD, or BAS.

Changing the Unit Enable Setpoint can be accomplished according to the following table.

Table 42, Unit Enable Conditions

Unit Off Input	Control Source Setpoint	Remote Input	Keypad Entry	BAS Request	Enable
OFF	x	x	x	x	OFF
x	SWITCHES	OFF	x	x	OFF
ON	SWITCHES	ON	x	x	ON
ON	KEYPAD	X	OFF	x	OFF
ON	KEYPAD	X	ON	x	ON
ON	NETWORK	x	x	OFF	OFF
ON	NETWORK	OFF	x	x	OFF
ON	NETWORK	ON	x	ON	ON

NOTE: An “x” indicates that the value is ignored

Unit Mode Selection

The overall operating mode of the chiller is set by the Unit Mode Setpoint with options of COOL, COOL w/Glycol, ICE w/Glycol, and TEST. This mode setting can be altered by the keypad, BAS, and Mode input. Changes to the Unit Mode Setpoint are controlled by two additional setpoints:

- Available Modes Setpoint: Determines the operational modes available at any time with options of COOL, COOL w/Glycol, COOL/ICE w/Glycol, and TEST.
- Control Source Setpoint: Determines the source that can change the Unit Mode Setpoint with options of KEYPAD, NETWORK, or SWITCHES.

When the Control source is set to KEYPAD, the Unit Mode stays at its previous setting until changed by the operator. When the Control source is set to BAS, the most recent BAS mode request goes into effect, even if it changed while the Control source was set to KEYPAD or DIGITAL INPUTS.

Changing the Unit Mode Setpoint can be accomplished according to the following table.

Table 43, Unit Mode Selection

Control Source Setpoint	Mode Input	Keypad Entry	BAS Request	Available Modes Setpoint	Unit Mode
x	x	x	x	COOL	COOL
x	x	x	x	COOL w/Glycol	COOL w/Glycol
SWITCHES	OFF	x	x	COOL/ICE w/Glycol	COOL w/Glycol
SWITCHES	ON	x	x	COOL/ICE w/Glycol	ICE w/Glycol
KEYPAD	x	COOL w/Glycol	x	COOL/ICE w/Glycol	COOL w/Glycol
KEYPAD	x	ICE w/Glycol	x	COOL/ICE w/Glycol	ICE w/Glycol
NETWORK	x	x	COOL	COOL/ICE w/Glycol	COOL w/Glycol
NETWORK	x	x	ICE	COOL/ICE w/Glycol	ICE w/Glycol
x	x	x	x	ICE w/Glycol	ICE w/Glycol
x	x	x	x	TEST	TEST

NOTE: An “x” indicates that the value is ignored.

Unit Test Mode

The unit test mode allows manual testing of controller outputs. Entering this mode requires the following conditions.

Unit OFF input = OFF (i.e., entire chiller is shut down).

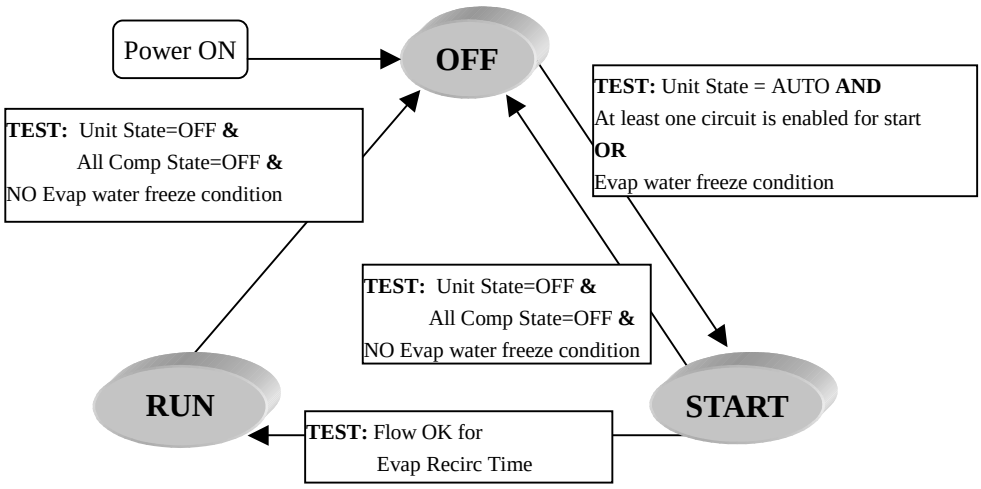
Manager password active.

Available Unit Mode setpoint = TEST

A test menu can then be selected to allow activation of the outputs. It is possible to switch each digital output ON or OFF and set the analog outputs to any value.

Chilled Water Pump Control

Operation of the evaporator pump is controlled by the state-transition diagram shown below.



Compressor Control

Compressor Sequencing

This section defines which compressor is the next one to start or stop. The next section defines when the start, or stop, is to occur.

Compressor sequencing is based primarily on compressor run-hours and starts. Compressors that have less starts will start before those with more starts. Compressors that have more run-hours will shut off before those with less run-hours. In the event of a tie on number of starts, the lower numbered compressor starts first. In the event of a tie on run-hours, the lower numbered compressor shuts off first.

If possible, the number of running compressors on each circuit will be balanced. If a circuit is unavailable for any reason, the other circuit is allowed to stage on all compressors.

Required Parameters

- Number of starts for all compressors
- Number of run-hours for all compressors
- Status of all compressors (Available/Unavailable)
- Compressor number

Compressor Start/Stop Timing-Cool Mode

This section defines when a compressor is to start, or stop, and the scenario for doing so.

Required Parameters

1. Start Delta setpoint.
2. Max Pulldown Rate setpoint
3. Evap Delta T setpoint
4. Number of Compressors/Circuit setpoint
5. LWT error
6. LWT Slope
7. Number of compressors running
8. Interstage timer status

Stage Up

For 2 compressors/circuit:
Control band = Evap Delta T x .25

For 3 compressors/circuit:
Control band = Evap Delta T x .17

IF [LWT Error > Startup_Delta_T_SP + 0.5(Control band)
AND No Compressors Running
AND Stage Up Timer Expired]
THEN Stage_Up_Now = YES

ELSE IF
[LWT Error > 0.5(Control band) AND LWT Slope <= Max Pulldown setpoint
AND Stage Up Timer Expired]
THEN Stage_Up_Now = YES

Stage Down

IF [LWT Error < -0.5(Control band)
AND Stage Down Timer Expires**]**
THEN Stage_Down_Now = YES

Compressor Start/Stop Timing – Ice Mode

This section defines when a compressor is to start, or stop, and the scenario for doing so.

Required Parameters

Start Delta setpoint
Evap Delta T setpoint
Number of Compressors/Circuit setpoint
LWT error
Number of compressors running
Interstage timer status
Ice timer status (12 hours between starts)

Stage Up

For 2 compressors/circuit:

Control band = Evap Delta T x .3

For 3 compressors/circuit:

Control band = Evap Delta T x .2

IF

[LWT Error > Startup_Delta_T_SP + 0.5(Control band)

AND Number Comps Running = 0

AND Ice Timer Expired]

THEN Stage_Up_Now = YES

ELSE IF

[LWT Error > 0

AND Number Comps Running > 0

AND Stage Up Timer Expired]

THEN Stage_Up_Now = YES

Stage Down

IF LWT Error < 0

THEN Stage_Down_Now = YES

Leaving Water Reset

The leaving water reset input uses a 4-to-20mA signal to reset the leaving water setpoint to a higher value. The adjustment varies linearly from 0 degrees F to 10 degrees F, with a reset of 0 for a 4mA signal and a reset of 10 for a 20mA signal.

At all times, the active leaving water setpoint is limited to a maximum of 60°F. The reset remains proportional within the 10 degree band, but the setpoint will simply stop resetting when it reaches the maximum.

Circuit Capacity Overrides – Limits of Operation

The following conditions override the automatic capacity control when the chiller is in COOL mode or ICE mode. These overrides keep a circuit from entering a condition in which it is not designed to run.

Low Evaporator Pressure

If a circuit is running, and the evaporator pressure drops below the Low Evaporator Pressure-Hold setpoint, no more compressors will be allowed to start on that circuit. This limit is active until the evaporator pressure reaches the hold setpoint plus 8 psi.

If a circuit is running with two or three compressors on, and the evaporator pressure drops below the Low Evaporator Pressure-Unload setpoint, the circuit will begin reducing capacity. If two compressors are running, one of the running compressors will be stopped. If three compressors are running, then one compressor will be stopped initially. Ten seconds later, if the pressure has not risen above the unload setpoint, another compressor will be stopped. The last compressor on a circuit will not stop due to the unload condition.

High Condenser Pressure

If the discharge pressure rises above the High Condenser Pressure Unload setpoint, and more than one compressor on the circuit is running, the circuit will stage down. One compressor will shutdown as soon as the pressure rises above the unload setpoint, and if two remain running, then one more will shut down 10 seconds later, if the pressure is still above the unload setpoint. No stage up will be allowed on the circuit until the condenser pressure drops to the unload setpoint, less 100 psi, and the outdoor ambient temperature drops 5 degrees F.

Low Ambient Lockout

If the OAT drops below the low ambient lockout setpoint, then all running circuits will do a normal stop. Once the lockout has been triggered, no compressors will start until the OAT rises to the lockout setpoint plus 5 degrees F.

High Ambient Limit

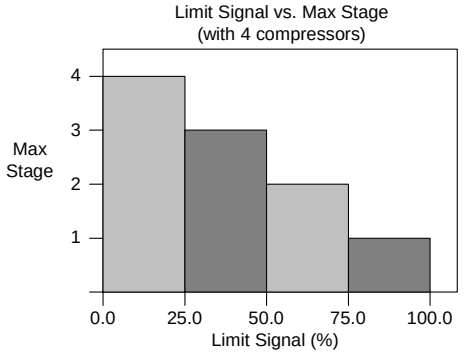
On units not configured with multi-point power connections, the maximum load amps could be exceeded at high ambient temperatures. If all circuit 1 compressors are running or all but one compressor on circuit 1, power connection is single point, and the OAT is greater than 116°F, circuit 2 is limited to running all but one compressor. The circuit 2 status will indicate if this is the case. This action will allow the unit to operate at higher temperatures than 116°F.

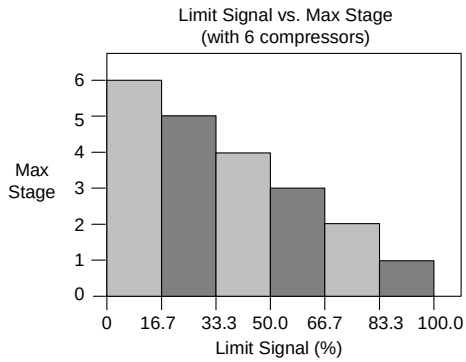
Unit Capacity Overrides

The following conditions override the automatic capacity control when the chiller is in COOL mode only.

Demand Limit

The maximum unit capacity can be limited by a 4-to-20 mA signal on the Demand Limit analog input. This function is only enabled if the Demand Limit setpoint is set to ON. The maximum unit capacity stage is determined as shown in the following graphs:





BAS Limit

The maximum unit capacity can be limited by a BAS signal. This function is only enabled if the unit control source is set to network. The maximum unit capacity stage is based on the BAS limit value received from the BAS, and is determined as shown in the graphs in the previous section.

Maximum LWT Rate

The maximum rate at which the leaving water temperature can drop is limited at all times by the Maximum Rate setpoint. If the rate exceeds this setpoint, no more compressors will be started until the pulldown rate is less than the setpoint.

Pumpdown

When a circuit reaches a condition where it needs to shut down normally, a pumpdown cycle will be performed. All but the lowest numbered running compressor will shut off. During pumpdown, the hot gas bypass and liquid line valves are closed, while a compressor continues to run. The pumpdown is complete when the evaporator pressure is less than the low evaporator pressure unload setpoint, less 15 psi, or the circuit has been in the pumpdown state for 60 seconds.

Condenser Fan Control

Stage Up Compensation

In order to create a smoother transition when another fan is staged on, the VFD compensates by slowing down initially. This is accomplished by adding the new fan stage up deadband to the VFD target. The higher target causes the VFD logic to decrease fan speed. Then, every 10 seconds, 0.5 degree F is subtracted from the VFD target until it is equal to the saturated condenser temperature target setpoint. This will allow the VFD to slowly bring the saturated condenser temperature back down.

Fantrol

Condenser Fans Staging is based on condenser pressure as selected by Fan Stage On & Off setpoints. Fans 1, 3, 5, and 7 are for circuit 1, and fans 2, 4, 6, and 8 are for circuit 2. Fans 1 and 2 start with the first compressor on the respective circuit when the ambient temperature is greater than 75°F. Below 75°F, these fans start when the condenser pressure gets up to the stage on setpoint. The compressor must be running in order to run any fans.

Fan Stages

There are 2, 3, or 4 fans available per circuit. On 8 fan units, fans 5/7 and 6/8 are controlled by one contactor for each pair, using virtual stages to allow a difference of only one fan between stages. See the tables below:

4 and 6 Fan Units

Stage (3-Fan)	Fans On Cir. 1	Fans On Cir. 2
1	1	2
2	1,3	2,4
3	1,3,5	2,4,6

8 Fan Units

Stage (2&4-Fan)	Fans On Cir 1	Fans On Cir. 2
1	1	2
2	1,3	2,4
3	1,5,7	2,6,8
4	1,3,5,7	2,4,6,8

Normal Operation - Staging Up

At startup, the first fan will start when the saturated condenser temperature rises above the target. After this, the stage-up deadbands apply.

When the saturated condenser temperature is above the Target + the active deadband, a Stage Up error is accumulated.

Stage Up Error Step = Saturated Condenser Refrigerant temperature – (Target + Stage Up dead band)

The Stage Up Error Step is added to Stage Up Accumulator once every Stage Up Error Delay seconds. When Stage Up Error Accumulator is greater than the Stage Up Error Setpoint another stage is started.

When a stage-up occurs or the saturated condenser temperature falls back within the Stage Up dead band, the Stage Up Accumulator is reset to zero.

Normal Operation - Staging Down

There are four Stage Down dead bands, one for each stage.

When the saturated condenser refrigerant temperature is below the Target – the active deadband, a Stage Down error is accumulated.

Stage Down Error Step = (Target – Stage Down dead band) – Saturated Condenser Refrigerant temperature

The Stage Down Error Step is added to Stage Down Accumulator once every Stage Down Error Delay seconds. When the Stage Down Error Accumulator is greater than the Stage Down Error Setpoint, another stage of condenser fans turns off. The last stage on will not shut off until the circuit is in an off state.

When a stage down occurs, or the saturated temperature rises back within the Stage Down dead band, the Stage Down Error Accumulator is reset to zero.

Forced Fan Stage At Start

Fans may be started simultaneously with the compressor based on outdoor ambient temperature. When the compressor starts, a Fantrol stage is forced based on the following table.

Table 44, Forced Fan Staging

,	Fantrol Stage At Start
> 75 °F	Forced Fan 1 SP
> 90 °F	Forced Fan 2 SP
> 105 °F	Forced Fan 3 SP

Up to four fans may be forced on when the compressor starts. If the unit has the Optional Low Ambient VFD option, then only three fans can start with the compressor, and the VFD will start normally when the saturated condenser temperature is higher than the target.

After forcing fans on, the saturated condenser temperature may temporarily stay below the target by some amount. In order to keep these fans from staging off, no stage down error can be accumulated until either the OAT drops below 75°F, or the saturated condenser temperature goes above the target.

Optional Low Ambient VFD

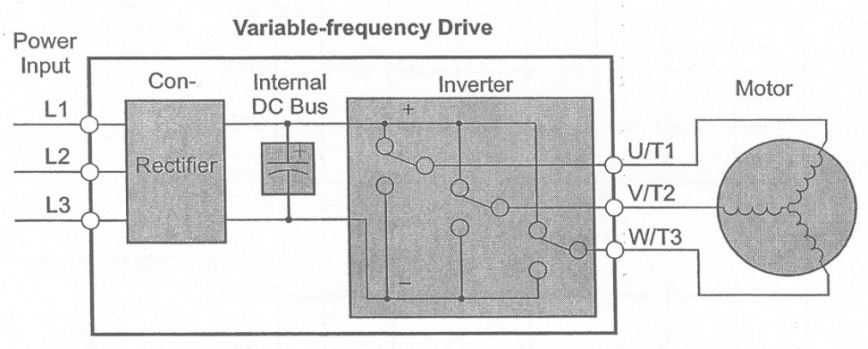
Low ambient air temperature control is accomplished by using the Optional Low Ambient VFD to control the speed of the first fan on each circuit. This VFD control uses a proportional integral function to drive the saturated condenser temperature to a target value by changing the fan speed. The target value is normally the same as the saturated condenser temperature target setpoint.

The fan VFD always starts when the saturated condenser temperature rises higher than the target.

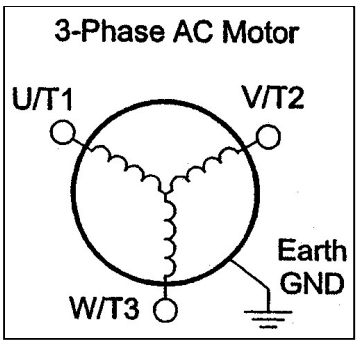
What is an Inverter?

The term inverter and variable-frequency drive are related and somewhat interchangeable. An electronic motor drive, for an AC motor, controls the motor's speed by varying the frequency of the power sent to the motor.

An inverter, in general, is a device that converts DC power to AC power. The figure below shows how the variable-frequency drive employs an internal inverter. The drive first converts incoming AC power to DC through a rectifier bridge, creating an internal DC bus voltage. Then the inverter circuit converts the DC back to AC again to power the motor. The special inverter can vary its output frequency and voltage according to the desired motor speed.



Inverter Output to the Motor



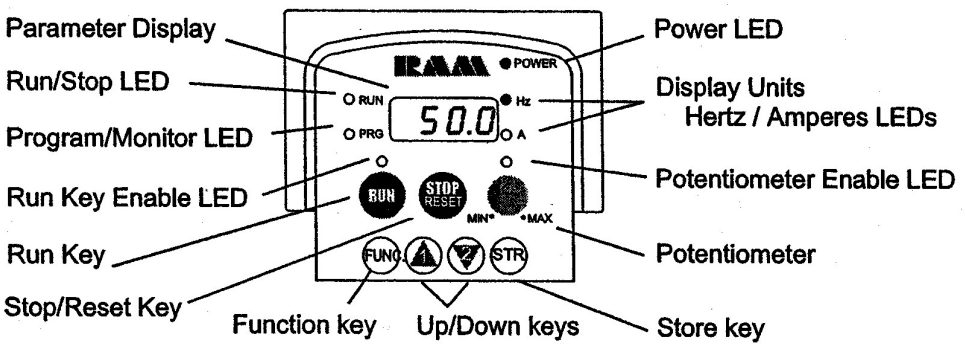
The AC motor must be connected only to the inverter's output terminals. The output terminals are uniquely labeled (to differentiate them from the input terminals) with the designations U/T1, V/T2, and W/T3. This corresponds to typical motor lead connection designations T1, T2, and T3. The consequence of swapping any two of the three connections is the reversal of the motor direction. This must not be done. In applications where reversed rotation could cause equipment damage or personnel injury, be sure to verify direction of rotation before attempting full-speed operation. For safety to personnel, the motor chassis ground must be connected to the ground connection at the bottom of the inverter housing.

Notice the three connections to the motor do not include one marked "Neutral" or "Return." The motor represents a balanced "Y" impedance to the inverter, so there is no need for a separate return. In other words, each of the three "Hot" connections serves also as a return for the other connections, because of their phase relationship.

Do not to switch off power to the inverter *while the motor is running* (unless it is an emergency stop). Also, do not install or use disconnect switches in the wiring from the inverter to the motor (except thermal disconnect).

Inverter Front Panel Keypad

The CR100 Series inverter front keypad contains all the elements for both monitoring and programming parameters. The keypad layout is pictured below. The fan VFD is programmed in the factory before shipment and no field programming is required.



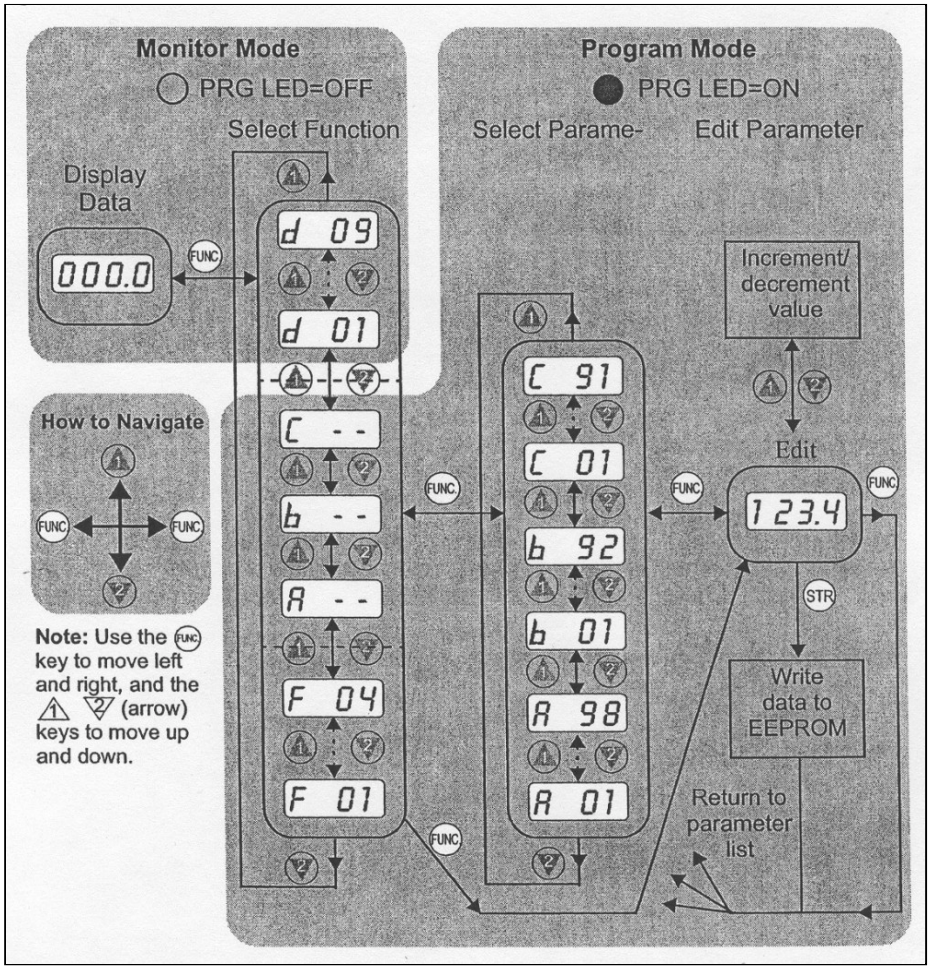
Key and Indicator Legend

Run/Stop LED - ON when the inverter output is ON and the motor is developing torque (Run Mode), and OFF when the inverter output is OFF (Stop Mode).
Program/Monitor LED - This LED is ON when the inverter is ready for parameter editing (Program Mode). It is OFF when the parameter display is monitoring data (Monitor Mode).
Run Key Enable LED - is ON when the inverter is ready to respond to the Run key, OFF when the Run key is disabled.
Run Key - Press this key to run the motor (the Run Enable LED must be ON first). Parameter F_04, Keypad Run Key Routing, determines whether the Run key generates a Run FWD or Run REV command.

Stop/Reset Key - Press this key to stop the motor when it is running (uses the programmed deceleration rate). This key will also reset an alarm that has tripped.
Potentiometer -Allows an operator to directly set the motor speed when the potentiometer is enabled for output frequency control.
Potentiometer Enable LED - ON when the potentiometer is enabled for value entry.
Parameter Display - A 4-digit, 7-segment display for parameters and function codes.
Display Units, Hertz/Amperes - One of these LEDs will be ON to indicate the units associated with the parameter display.
Power LED - This LED is ON when the power input to the inverter is ON.
Function Key - This key is used to navigate through the lists of parameters and functions for setting and monitoring parameter values.
Up/Down (▲1 , ▽2) Keys - Use these keys alternately to move up or down the lists of parameter and functions shown in the display, and increment/decrement values.
Store (STR) Key - When the unit is in Program Mode and you have edited a parameter value, press the Store key to write the new value to the EEPROM.

Keypad Navigational Map

The CR100 Series inverter front keypad contains all the elements for both monitoring and programming parameters. The diagram below shows the basic navigational map of parameters and functions.



NOTE: The inverter 7-segment display shows lower case “b” and “d,” meaning the same as the upper case letters “B” and “D” used in this manual (for uniformity “A to F”).

NOTE: The Store Key saves the edited parameter (shown in the display) to the EEPROM in the inverter, regardless of the programming device. Upload and download of parameters is accomplished through a separate command—do not confuse *Store* with *Download* or *Upload.*

Troubleshooting Tips

The table below lists typical symptoms and the corresponding solution(s).

Symptom Condition		Probable Cause	Solution
The motor will not run.	The inverter outputs [U], [V], [W] are not supplying voltage.	• Is the frequency command source A_01 parameter setting correct? • Is the Run command source A-02 parameter setting correct?	• Make sure the parameter setting A-01 is correct. • Make sure the parameter setting A-02 is correct.
		• Is power being supplied to terminals [L1], [L2], and [L3/N]? If so, the POWER lamp should be ON.	• Check terminals [L1], [L2], and [L3/N], then [U/T1], [V/T2], and [W/T3]. • Turn ON the power supply or check fuses.
		• Is there an error code *E X X* displayed?	• Press the Func. key and determine the error type. Eliminate the error cause, then clear the error (Reset).
		• Are the signals to the intelligent input terminals correct? • Is the Run Command active? Is the {FW] terminal (or [RV]) connected to [P24] (via switch, etc.)	• Verify the terminal functions for C_01 – C_05 are correct. • Turn ON Run Command enable. • Supply 24V to {FW] or [RV] terminal, if configured.
		• Has the frequency setting for F_01 been set greater than zero? • Are the control circuit terminals [H], [O], and [L] connected to the potentiometer?	• Set the parameter for F_01 to a safe, non-zero value. • If the potentiometer is the frequency setting source, verify voltage at [O] > 0V.
		• Is the RS (reset) function or FRS (free-run stop) function ON?	• Turn OFF the command(s).
	Inverter outputs [U], [V], [W] are supplying voltage.	• Is the motor load too heavy?	• Reduce load, and test the motor independently.
	The optional remote operator is used (SRW).	• Are the operational settings between the remote operator and the inverter unit correct?	• Check the operator type setting.
The direction of the motor is reversed.		• Are the connections of output terminals [U/T1], [V/T2], and [W/T3] correct? • Is the phase sequence of the motor forward or reverse with respect to [U/T1], [V/T2], and [W/T3]?	• Make connections according to the phase sequence of the motor. In general: FWD = U-V-W, and REV = U-W-V.
		• Are the control terminals [FW] and [RW] wired correctly? • Is parameter F_04 properly set?	• Use terminal [FW] for forward, and [RV] for reverse. • Set motor direction in F_04.
The motor speed will not reach the target frequency (desired speed).		• If using the analog input, is the current or voltage at [O] or [OI]?	• Reduce the load. • Heavy loads activate the overload restriction feature (reduces output as needed).
		• Is the load too heavy?	• Reduce the load • Heavy loads activate the overload restriction feature (reduces output as needed).
		• Is the inverter internally limiting the output frequency?	• Check max frequency setting (A_04). • Check frequency upper limit setting (A_61).

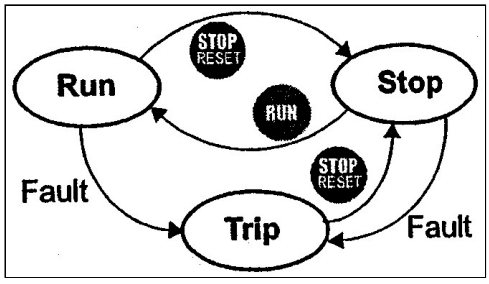
Continued on next page.

Symptom Condition		Probable Cause	Solution
The RPM of the motor does not match the inverter output frequency setting.		• Is the maximum frequency setting A_04 correct? • Does the monitor function D_01 display the expected output frequency?	• Verify the V/f settings match motor specification. • Make sure all scaling (such as A_11 to A_14) is properly set.
Inverter data is not correct.	No downloads have occurred.	• Was power turned OFF after a parameter edit but before pressing the Store key?	• Edit the data and press the Store key once.
		• Edits to data are permanently stores at power down. Was the time from power OFF to power ON less than six seconds?	• Wait six seconds or more before turning power OFF after editing data.
	A download to the inverter was attempted.	• Was the power turned OFF within six seconds after the display changed from REMT to INV?	• Copy data to the inverter again, and keep power ON for six seconds or more after copying.
A parameter will not change after an edit (reverts to old setting).	True for certain parameters.	• Is the inverter in Run Mode? Some parameters cannot be edited during Run Mode.	• Put inverter in Stop Mode (press the Stop/reset key). Then edit the parameter.
	True for all parameters.	• If you're using the [SFT] intelligent input (software lock function)—is the [SFT] input ON?	• Change the state of the SFT input, and check the B_31 parameter (SFT mode).

Monitoring Trip Events, History. & Conditions

Fault Detection and Clearing

The microprocessor in the inverter detects a variety of fault conditions and captures the event, recording it in a history table. The inverter output turns OFF, or "trips" similar to the way a circuit breaker trips due to an over-current condition. Most faults occur when the motor is running (refer to the diagram to the right). However, the inverter could have an internal fault and trip in Stop Mode. In either case, you can clear the fault by pressing the Stop/Reset key.



Error Codes

An error code will appear on the display automatically when a fault causes the inverter to trip The following table lists the cause associated with the error.

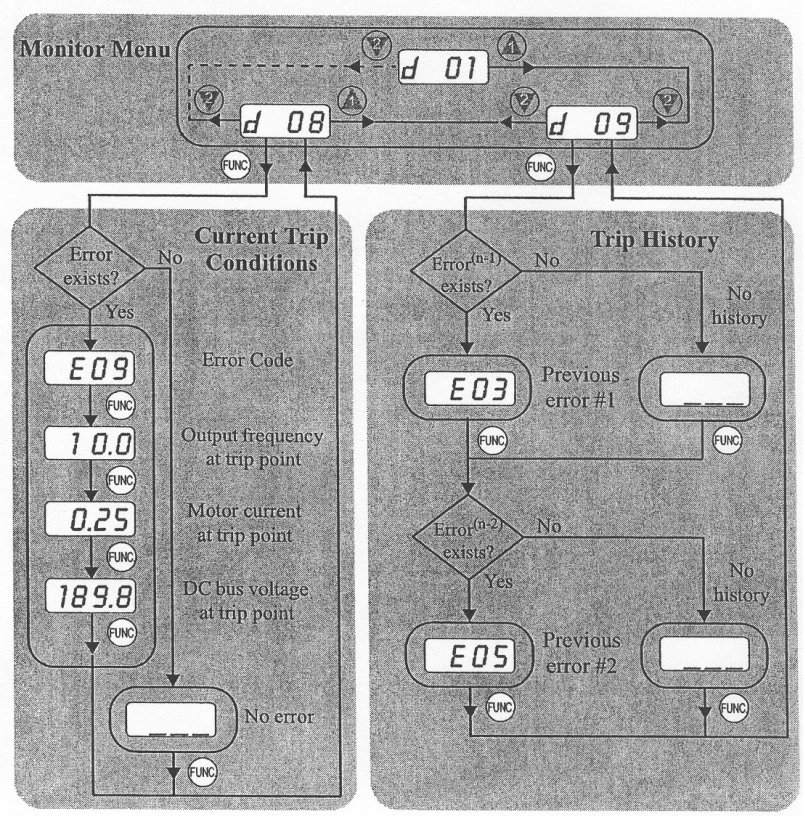
Error Code	Name	Cause(s)
E01	Over current event while at constant speed	The inverter output was short-circuited, or the motor shaft is locked or has a heavy load. These conditions cause excessive current *for the* inverter, so the inverter output is turned OFF. The dual-voltage motor is wired incorrectly.
E02	Over current event during deceleration	
E03	Over current event during acceleration	
E04	Over current event during other conditions	
E05	Overload protection	When a motor overload is detected by the electronic thermal function, the inverter trips and turns OFF its output.
E07	Over voltage protection	When the DC bus voltage exceeds a threshold, due to regenerative energy from the motor.
E08	EEPROM error	When the built-in EEPROM memory has problems due to noise or excessive temperature, the inverter trips and turns OFF its output to the motor.
E09	Under-voltage error	A decrease of internal DC bus voltage below a threshold results in a control circuit fault This condition can also generate excessive motor heat or cause low torque. The inverter trips and turns OFF its output.
E11 *E22*	CPU error	A malfunction in the built-in CPU has occurred, so the inverter trips and turns OFF its output to the motor.
E12	External trip	A signal on an intelligent input terminal configured as EXT has occurred. The inverter trips and turns OFF the output to the motor.
E13	USP	When the Unattended Start Protection (LJSP) is enabled, an error occurred when power is applied while a Run signal is present. The inverter trips and does not go into Run Mode until the error is cleared.
E14	Ground fault	The inverter is protected by the detection of ground faults between the inverter output and the motor during powerup tests. This feature protects the inverter, and does not protect humans.
E15	Input over-voltage	When the input voltage is higher than the specified value, it is detected 100 seconds after powerup and the inverter trips and turns OFF its output.
E21	Inverter thermal trip	When the inverter internal temperature is above the threshold, the thermal sensor in the inverter module detects the excessive temperature of the power devices and trips, turning the inverter output OFF.
E35	Thermistor	When a thermistor is connected to terminals {5} and [CM1] and the inverter has sensed the temperature is too high, the inverter trips and turns OFF the output.
---U	Under-voltage (brownout) with output shutoff	Due to low input voltage, the inverter turns its output OFF and tries to restart. If it fails to restart, then the alarm trips to record the under-voltage error event.

Note: If an EEPROM error (E08) occurs, be sure to confirm the parameter data values are still correct. If the power is turned OFF while the [RS] (Reset) intelligent input terminal is ON, an EEPROM error will occur when power is restored.

Trip History and Inverter Status

Always find the cause of the fault before clearing it. When a fault occurs, the inverter stores important performance data at the moment of the fault. To access the data, use the monitor functions (D_xx) and select D_08 for details about the present fault (E^{n}), or the error code for the past two trip events (E^{n-1}) and E^{n-2}) using the D_09 Trip History function.

The following Monitor Menu map shows how to access the error codes. When fault(s) exist, you can review their details by first selecting the proper function: D_08 displays current trip data, and D09 displays trip history.



VFD Monthly and Yearly Inspection Chart

Item Inspected		Check for ...	Frequency		Inspection Method	Criteria
			Month	Year		
Overall	Ambient environment	Extreme Temperatures & humidity	✓		Thermometer, hygrometer	Ambient temperature between – 10 to 40°C, non-condensing
	Major devices	Abnormal noise & vibration	✓		Visual & aural	Stable environment for electronic controls
	Power supply voltage	Voltage tolerance	✓		Digital volt meter, measure between inverter terminals [L1], [L2], [L3}	200V class: 200 to 240V 50/60 Hz 400V class: 380 to 460V 50/60 Hz
Main circuit	Ground Insulation	Adequate resistance		✓	Digital volt meter, GND to terminals	5 Meg. Ohms or greater
	Mounting	No loose screws		✓	Torque wrench	M3: 0.5 – 0.6 Nm M4: 0.98 – 1.3 Nm M5: 1.5 – 2.0 Nm
	Components	Overheating		✓	Thermal trip events	No trip events
	Housing	Dirt, dust		✓	Visual	Vacuum dust & dirt
	Terminal block	Secure connections		✓	Visual	No abnormalities
	Smoothing capacitor	Leading, swelling	✓		Visual	No abnormalities
	Relay(s)	Chattering		✓	Aural	Single click when switching ON or OFF
	Resistors	Cracks or discoloring		✓	Visual	Use Ohm meter to check braking resistors
	Cooling fan	Noise	✓		Power down, manually rotate	Rotation must be smooth
		Dust	✓		Visual	Vacuum to clean
Control circuit	Overall	No order, discoloring, corrosion		✓	Visual	No abnormalities
	Capacitor	No leaks or deformation	✓		Visual	Undistorted appearance
Display	LEDs	Legibility	✓		Visual	All LED segments work

Important Messages

WARNING

WARNING HIGH VOLTAGE: Motor control equipment and electronic controllers are connected to hazardous line voltages. When servicing drives and electronic controllers, there may be exposed components with housings or protrusions at or above line potential. Extreme care should be taken to protect against shock.
Stand on an insulating pad and make it a habit to use only one hand when checking components. Always work with another person in case an emergency occurs.
Disconnect power before checking controllers or performing maintenance. Be sure equipment is properly grounded. Wear safety glasses whenever working on electronic controllers or rotating machinery.

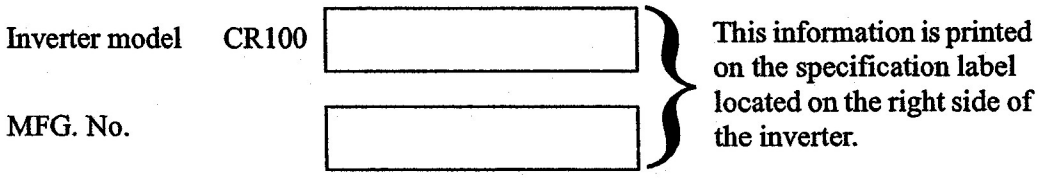
WARNING

Wait at least five (5) minutes after turning OFF the input power supply before performing maintenance or an inspection.
Otherwise, there is the danger of electric shock.

Introduction

This end of this section lists the parameters for the CR100 series inverters and the values as programmed in the factory.

Unit identification



Parameter Settings for Keypad Entry

Main Profile Parameters

"F" Group Parameters		McQuay Setting
Function Code	Name	
F_01	Output Frequency Setting	0.0
F_02	Acceleration (1)	10.0
F_03	Deceleration (1)	10.0
F_04	Keypad Run Key Routing	00

Standard Functions

"A" Group Parameters		McQuay Setting
Function Code	Name	
A_01	Frequency source setting	01
A_02	Run command source setting	01
A_03	Base frequency setting	60.0
A_04	Maximum frequency setting	60.0
A_11	O-L input active range start frequency	0

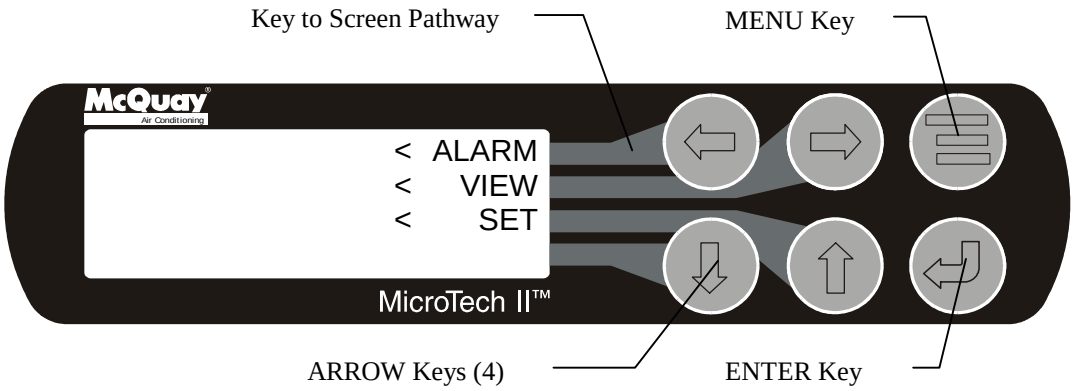
Using the Controller

4x20 Display & Keypad

Layout

The 4-line by 20-character/line liquid crystal display and 6-key keypad are shown below.

Figure 26, Display (in MENU mode) and Keypad Layout



Note that each ARROW key has a pathway to a line in the display. Pressing an ARROW key will activate the associated line when in the MENU mode.

Getting Started

There are two basic procedures to learn in order to utilize the MicroTech II controller:

1. Knowing where a particular screen is located and navigating through the menu matrix to reach it.
2. Knowing what is contained in a menu screen and how to read that information or how to change a setpoint contained in the menu screen.

Navigating Through the Menus

The menus are arranged in a matrix of screens across a top horizontal row. Some of these top-level screens have sub-screens located under them. The general content of each screen and its location in the matrix are shown in Figure 28 on page 80. A detailed description of each menu begins on page 81.

There are two ways to navigate through the menu matrix to reach a desired menu screen.

1. Scroll Mode: Scroll through the matrix from one screen to another using the four ARROW keys.
2. Menu Mode: Use shortcuts to work through the matrix hierarchy. From any menu screen, pressing the MENU key will take you to the top level of the hierarchy. The display will show ALARM, VIEW, and SET as shown in Figure 26. This corresponds to the second row of screens on Figure 28. One of these groups of

screens can then be selected by pressing the key connected to it via the pathway shown in Figure 26.

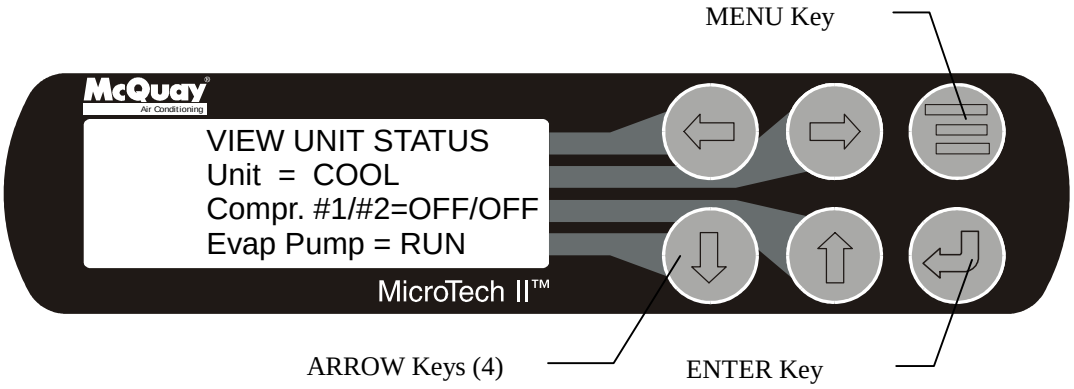
For example, selecting ALARM will go the next row of menus under ALARM (ALARM LOG or ACTIVE ALARM). Selecting VIEW will go the next level of screens under VIEW (VIEW UNIT STATUS or VIEW UNIT TEMP). Selecting SET will go to a series of screens for viewing and changing setpoints.

MENU Key

The MENU key is used to switch between the shortcut method (known as the MENU mode and as shown in Figure 26) and scrolling method (known as the SCROLL mode shown in Figure 27). The MENU mode is the shortcut to specific groups of menus used for checking ALARMS, for VIEWING information, or to SET setpoint values. The SCROLL mode allows the user to move about the matrix (from one menu to another, one at a time) by using the four ARROW keys. A typical menu screen is shown in Figure 27.

Pressing the MENU key from any menu screen will automatically return you to the MENU mode as shown in Figure 26.

Figure 27, Display in the Shortcut (SCROLL) Mode and Keypad Layout



Menu Screens

The menus are shown in the controller display. Each menu screen shows specific information; in some cases menus are used only to *view* the status of the unit, in some cases they are used for checking and clearing *alarms*, and in some cases they are used to *set* setpoint values.

The ARROW keys on the controller can be used to navigate through the menus. The keys are also used to change numerical setpoint values contained in certain menus.

Changing Setpoints

Pressing the ENTER key changes the function of the ARROW keys to the editing function as shown below:

LEFT key	Default, changes a value to the factory-set default value.
RIGHT key	Cancel, cancels any change made to a value and returns to the original setting.
UP key	Increment, increases the value of the setting
DOWN key	Decrement decreases the value of a setting.

These four edit functions are indicated by one-character abbreviation on the right side of the display (this mode is entered by pressing the ENTER key).

Most menus containing setpoint values have several different setpoints shown on one menu. When in a setpoint menu, the ENTER key is used to proceed from the top line to the second line and on downward. The cursor will blink at the entry point for making a change. The ARROW keys (now in the edit mode) are used to change the setpoint, as described above. When the change has been made, press the ENTER key to enter it. No setting is changed until the ENTER key is pressed.

For example, to change the chilled water setpoint:

1. Press MENU key to go to the MENU mode (see Figure 26).
2. Press SET (the UP Key) to go to the setpoint menus.
3. Press UNIT SPs (the Right key) to go to setpoints associated with unit operation.
4. Press the DOWN key to scroll down through the setpoint menus to the third menu which contains Evap LWT=XX.X°F.
5. Press the ENTER key to move the cursor down from the top line to the second line in order to make the change.
6. Use the ARROW keys (now in the edit mode as shown above) to change the setting.
7. When the desired value is achieved, press ENTER to enter it. The cursor will automatically move down.

At this point, the following actions can be taken:

1. Change another setpoint in this menu by scrolling to it with the ENTER key
2. Using the ENTER key, scroll to the first line in the menu. From there the ARROW keys can be used to scroll to different menus.

Menu Structure (Hierarchical)

As discussed previously, a hierarchical menu structure can be used to access the various screens. One to twenty-five levels can be used below the top-level menu, with two or three being typical. Optionally, the last menu selection can access one of a set of screens that can be navigated with the UP/DOWN ARROW keys (see the scrolled menu structure below).

Menu selection is initiated by pressing the MENU key that changes the display from a regular data screen to a menu screen. Menu selections are then made using the arrow keys according to labels on the right side of the display (the arrows are ignored). When the last menu item is selected, the display changes to the selected data screen. An example follows showing the selection of the "VIEW COMPRESSOR (n) screen.

Assume the initial screen resembles the screen below or any other menu screen:

```
ALARM LOG
     (data)
     (data)
     (data)
```

After pressing the MENU key, the top level menu screen will show:

```
                < ALARM
                <  VIEW
                <   SET
```

After pressing the “VIEW” menu key, a menu screen will show:

```
VIEW    <       UNIT
        < COMPRESSOR
        < REFRIGRANT
        <       FANS
```

Selection of any of these will advance to the appropriate data menu. For example, after pressing the “**REFRIGERANT**” menu button, the selected data screen will show:

```
VIEW REFRIG
          PSI    °F
SAT EVAP XXX.X  XX.X
SAT COND XXX.X  XX.X
```

The ARROW keys will automatically return to the “scroll” mode at this time.

Screen Definitions: VIEW

This section contains information on each menu screen. The menu screens are in order of the matrix in Figure 28, going from left to right and then down when there are sub-menus. Many menus are self-explanatory.

VIEW UNIT STATUS

```
VIEW UNIT STATUS (1)
Off:Unit Switch
Cool Stage=0
Evap Pump=Off
```

Unit states can be OFF, AUTO, and ALARM as determined by the authority Switch, Remote, Etc.

```
VIEW UNIT STATUS (2)
Demand Limit= Stg X
Network Limit=Stg X
```

```
VIEW UNIT STATUS (3)
Stg Up Delay=XXXXsec
Stg Dn Delay=XXXXsec
Ice Delay=   XXh XXm
```

Ice Delay only appears when in the ICE mode.

```
VIEW UNIT STATUS (4)
D.O.      111111111
 123456789012345678
 111111111111111111
```

This menu gives the status of digital outputs (D.O.), 1=ON, 0=OFF. Numbers are 1 through 18. See Table 38, Digital Outputs, on page 56 for number reference.

```
VIEW UNIT STATUS (5)
D.I.      111111111
 1234567890123456789
 111111111111111111
```

This menu gives the status of digital inputs (D.I.). 1=ON, 0=OFF. Numbers are 1 through 18. See Table 37, Digital Inputs, on page 56 for number reference.

```
VIEW UNIT STATUS (6)
   Analog Outputs
   (volts X 100)
1=XXX.X   2=XXX.X
```

This menu give the output voltage for fans #1 and #2 VFD. Divide by 100 for actual voltage.

VIEW UNIT TEMPERATURES

```
VIEW UNIT TEMP   (1)
Evap LWT =  XXX.X °F
OAT = XXX.X °F
LWT Target = XX.X °F
```

```
VIEW UNIT TEMP   (2)
LWT Pulldn=XX.X °F/m
Control Band=XX.X °F
```

VIEW CIRCUIT STATUS

The following four screens are duplicated for circuit # 2. Units with two compressors per circuit (AGZ 026 through AGZ 090) will not have screen #4 present. Circuit 1 has compressor #1, #3, (#5), circuit 2 has compressor #2, #4, (#6).

```
VIEW CIR1 STATUS (1)
Off:Pumpdown Switch
```

```
VIEW CIR1 STATUS (2)
Comp1=Off
Hours= XXXXX
Starts= XXXXX
```

```
VIEW CIR1 STATUS (3)
Comp3=Off
Hours= XXXXX
Starts= XXXXX
```

```
VIEW CIR1 STATUS (4)
Comp5=Off
Hours= XXXXX
Starts= XXXXX
```

SCREEN DEFINITION: VIEW REFRIGERANT

The following three screens are duplicated for circuit #2.

```
VIEW REFRG CIR 1 (1)
Evap Press= XXX.Xpsi
Cond Press= XXX.Xpsi
```

```
VIEW REFRG CIR 1 (2)
Sat Evap= XXX.X °F
Sat Cond= XXX.X °F
VFD Target= XXX.X °F
```

```
VIEW REFRG CIR 1 (3)
Suct Temp= XXX.X °F
Superheat= XXX.X °F
Evap Appr= XX.X °F
```

Evap Appr (evaporator approach temperature) is the difference between the leaving fluid temperature and the saturated evaporator temperature. It is an indication of the evaporator efficiency; an increasing approach temperature indicates decreasing heat transfer efficiency.

SCREEN DEFINITION: VIEW FANS

```
VIEW FANS          (1)
  Fans On  VFD Speed
Cir 1= X     XXX.X%
Cir 2= X     XXX.X%
```

```
VIEW FANS          (2)
Stg Error  Up   Down
Cir 1=     XXX  XXX
Cir 2=     XXX  XXX
```

```
VIEW FANS          (3)
Sat Cond
 Target= XXX.X°F
```

See explanation of fan operation on page 65.

Screen Definitions – ALARM

```
Alarm Log          (X)
Alarm Description
Time/Date
Data:Edit and scroll
```

The last 25 alarms, either shutdown or limit, are shown in this menu with earlier alarm menus stored under it. ARROW DOWN from this menu will go to the next-to-last alarm, ARROW DOWN again will go to the second from last, and so on through the last 25 occurrences. The screens are numbered (1), (2), (3),....(X).

```
Alarm Active
Alarm Description
Time/Date
```

.

```
Alarm Active
No more alarms
Press ENTER to clear
   all active alarms
```

If the unit is off on a shutdown alarm, or running, but in a limit alarm condition, the cause, date/time, and UNIT STATUS will appear in the ALARM ACTIVE screen. The remote alarm relay will close, and a red light will appear behind the LEFT button. The light will go out when the fault is cleared. If there is a simultaneous occurrence of more than one alarm, the others will appear in additional screens below this one, accessed by the DOWN ARROW.

If an alarm occurs, press the MENU button, then the LEFT button for ALARM, and then the left button again to reach the ALARM ACTIVE screen.

The cause of the alarm must be remedied before attempting to clear the alarm. To clear the alarm(s), scroll down to the last screen (bottom screen above) and press ENTER. The SET UNIT SPs screen will appear and the password will be asked for. Press ENTER and the cursor will flash in the password field. Press the UP button to scroll the numbers up to the required password. Press ENTER to clear.

If other faults have appeared, they will all be cleared at the same time.

Screen Definitions – SET

Changing setpoints; in general, setpoints are changed as follows:

1. Select the desired menu by scrolling through SET menus with the UP, DOWN, LEFT and RIGHT ARROWS. Alternatively, press the MENU button, select the type of setpoint desired, then up or down to the exact screen.
2. When the desired menu is selected, select the desired field within the menu by moving between lines using the ENTER key. Some fields may not be accessible due to settings in other menus.
3. If a numerical value is being changed, use the INCREMENT key (UP ARROW) to increase or the DECREMENT key (DOWN ARROW) to decrease the value of the setpoint.

If a word-type setpoint (for example, YES or NO) is to be selected, the choices are loaded into the menu and selected by scrolling through the available setpoint options using the UP ARROW key.

4. Enter the desired value or word into the controller by pressing the ENTER key.

Stated another way, once the desired set screen is reached, editing is accomplished by pressing the ENTER key until the desired field is selected within the set screen. This field is indicated by the cursor blinking on it. The arrow keys will then operate as defined below.

CANCEL	Reset the current field to the value it had when editing began.
DEFAULT	Set value to original factory setting.
INCREMENT	Increase the value or select the next item in a list.
DECREMENT	Decrease the value or select the previous item in a list.

During edit mode, the display shows a two-character-wide menu pane on the right as shown below. These characters relate to the functions shown above. After a field has been set to the desired new values, press ENTER. This enters the value and scrolls to the next field.

```
SET UNIT SPs (X)   <D
     (data)        <C
     (data)        <+
     (data)        <-
```

Additional fields can be edited by pressing the ENTER key until the desired field is selected.

Two four-digit passwords provide OPERATOR and MANAGER levels of access to setpoints. The passwords are preprogrammed into the controller. The Operator Password is 0100, the Manager Password is 2001. Either password must be entered using the ENTER PASSWORD screen (15) before a protected setting can be changed.

This screen can be accessed either through the SET OTHER menu, or by simply pressing the ENTER key while on one of the SET screens. The controller will automatically go from the screen with the setting change to this screen. After the correct password has been entered, the controller will automatically return to the original set screen.

Once a password has been entered, it remains valid for 15 minutes after the last key-press.

```
SET UNIT SPs (1)
Unit Enable=OFF
Mode=COOL
Source=KEYPAD
```

Unit Enable is an external signal, or a keypad setting, that keeps the unit off when the setting is OFF, and *allows* it to run if there is a call for cooling when the setting is ON. The source for the signal is selected in the 4th line and can be:

1. KEYPAD, in which case the selection is made in line 2 and would be normally selected as ON. This is the normal setting when no external signals are controlling the unit.
2. DIGITAL INPUT, in which an external switch is wired across terminals #52 and #72. (See wiring diagram page 50).
3. BAS, used with BAS signal.

Unit Mode settings can be:

1. COOL, normal setting used with chilled water air-condition applications.
2. COOL w/GLYCOL, used with low temperature glycol applications. It allows a lower LWT setpoint to be used.
3. ICE w/GLYCOL, used with ice storage systems, allows changing from chilled glycol operation to lower temperature ICE operation. In ICE, the unit runs at full load until the ICE setpoint is reached, at which time the unit shuts off. A three-position switch wired to terminals #28 and #38 initiates the change from glycol cooling to making ice. (See wiring diagram on page 50.)
4. TEST, for use by service technician for certain test procedures.

```
SET UNIT SPs (2)
Available Modes
  =COOL w/Glycol
Set w/ FP Switch Off
```

Available Modes settings can be COOL, COOL w/Glycol, ICE w/Glycol, or TEST as selected from the available modes imbedded in the menu. The 4th line is a reminder that the ON/OFF switch on the front panel (FP) must be in the OFF position before the MODE can be changed. This prevents a mode change while the unit is operating.

```
SET UNIT SPs (3)
Evap LWT =  XX.X°F
Ice LWT =  XX.X°F
```

```
SET UNIT SPs (4)
EvapDeltaT= XX.X°F
StartDelta= XX.X°F
Stop Delta = XX.X°F
```

See the Compressor Control section beginning on page 61 for explanation.

```
SET UNIT SPs     (5)
Max Pulldn=X.X°F/min
Evap Recirc=XXX sec
LowAmbLock= XX.X°F
```

```
SET UNIT SPs     (6)
Demand Limit=No
Multipoint Power=No
```

```
SET UNIT SPs (7)
       CLOCK
     dd/mmm/yyyy
       hh:mm:weekday
```

```
SET UNIT SPs (8)
Units = °F/psi
Lang  = ENGLISH
```

Units settings are only °F/psi at the present time. °C/kPa will be available later.

Lang (Language) settings can be only ENGLISH at present.

```
SET UNIT SPs (9)
Protocol = MODBUS
Ident Number=001
Baud Rate=9600
```

```
SET UNIT SPs    (10)
Evap Pressure Sensor
Cir1 Offset= XX.Xpsi
Cir2 Offset= XX.Xpsi
```

The pressure offsets on menus 10 and 11 and the temperature offsets on menus 12, 13 and 14 correct the controller's display of the parameters. The sensors used in these units have a high degree of repeatability but may need initial correction (offset). An accurate pressure gauge or thermometer is used to determine the correct temperature or pressure. A positive or negative offset value is then entered to make the controller reading agree with the measured value.

```
SET UNIT SPs    (11)
Cond Pressure Sensor
Cir1 Offset= XX.Xpsi
Cir2 Offset= XX.Xpsi
```

```
SET UNIT SPs    (12)
Suction Temp Sensor
Cir 1 Offset= XX.X °F
Cir 2 Offset= XX.X °F
```

```
SET UNIT SPs    (13)
Leaving Evaporator
Water Temp Sensor
Offset= XX.X °F
```

```
SET UNIT SPs    (14)
Outside Ambient
Temperature Sensor
Offset= XX.X °F
```

```
SET UNIT SPs (15)
ENTER PASSWORD XXXX
Active Password
Level:None
```

SET COMP SETPOINTS

```
SET COMP SPs (1)
# of Compressors =X
Stop-Start  =XXmin
Start-Start =XXmin
```

This menu sets the anti-recycle timers. Stop-Start is the time required before starting a compressor after it has *stopped*. Start-Start is the time required before starting a compressor after the last time it has *started*. It is recommended that these default values not be changed.

```
SET COMP SPs (2)
InterStageUp=XXXsec
InterStageDn=XXXsec
Clear Cycle Tmrs =no
```

InterStageUp is the time delay since the last stage change before a compressor can stage on.

InterStageDn is the time delay since the last stage change before a compressor can stage off normally (not by an alarm).

SET LIMIT ALARMS

```
SET ALARM LMTS (1)
LowEvPrHold=XXXpsi
LowEvPrUnld=XXXpsi
```

The LowEvPrHold and LowEvPrUnld have the same default value of 59 psi. If two compressors are running, the LowEvPrUnld is in effect and the lag compressor will be shut off to unload the unit. If one compressor is running, the LowEvPrHold is in effect and the lag compressor is prevented from starting, thereby holding the unit capacity.

```
SET ALARM LMTS (2)
Evap Freeze= XX.X°F
EvapFlowProof=XXXsec
```

Evap Freeze (the unit freeze protection shutdown) is actually a stop alarm and shuts off the unit when the LWT reaches 36°F. It is cleared by going to the CLEAR ALARM menu in the ACTIVE ALARM hierarchy.

EvapFlowProof is a time delay on the flow switch trip that reduces nuisance low flow trips. The default setting is 5 seconds.

```
SET ALARM LMTS (3)
HighCondPr = XXXpsi
HiCondStgDn = XXXpsi
```

HighCondPr (the unit high-discharge-pressure shutdown) is a stop alarm that shuts off the unit when the discharge pressure reaches the setting. The default setting is 385 psi. The HiCondStDn is a limit alarm that unloads the unit in an attempt to prevent total shutdown from the HighCondPr. The stage down is set at 370 psi.

```
SET ALARM LMTS (4)
PhaseVoltage=YES/NO
GroundFault=YES/NO
```

SET FAN STAGES

```
SET FANS SPs (1)
Number of Fans = X
Fan VFD = YES/NO
```

The Number of Fans line tells the controller the number of fans on the unit. The UP ARROW toggles between 4, 6 and 8.

Fan VFD tells the controller whether the optional low ambient fan VFD is installed in the unit. The UP ARROW toggles between YES and NO. The setting changes the range available: YES = -2°F to 60°F, NO = 35°F to 60°F.

```
SET FANS SPs     (2)
Stg Up Deadband(°F)
  Stg2  Stg3  Stg4
  XX.X  XX.X  XX.X
```

```
SET FANS SPs     (3)
Stg Dn Deadband(°F)
Stg0 Stg1 Stg2 Stg3
XX.X XX.X XX.X XX.X
```

```
SET FANS SPs     (4)
VFD Min Speed=  XX%
VFD Max Speed= XXX%
```

```
SET FANS SPs     (5)
Cond Sat Temp Target
Setpoint= XXX.X °F
```

```
SET FANS SPs      (6)
# Fans On At Startup
 >75°F >90°F >105°F
    1     2     3
```

Screen Definitions – TEST

The field test screens are only available when the unit is in TEST mode. Using these screens, any digital output can be controlled manually.

```
TEST UNIT         (1)
Alarm Signal=Off
EvapWaterPump=Off
```

```
TEST UNIT         (2)
Liq Line Sol 1=Off
Compressor  HG1=Off
1=Off 3=Off 5=Off

Pre Start-up

The chiller must be inspected to ensure no components became loose or damaged during shipping or installation.

Start-Up

Refer to the MicroTech II Controller section beginning on page 54 to become familiar with its operation before starting chiller.

There should be adequate building load (at least 50 percent of the unit full load capacity) to properly check the operation of the chiller refrigerant circuits.

Be prepared to record all operating parameters required by the "Compressorized Equipment Warranty Form". Return this information within 10 working days to McQuay International as instructed on the form to obtain full warranty benefits.

1. Verify chilled water flow.
2. Verify remote start / stop or time clock has requested the chiller to start.
3. Set the chilled water setpoint to the required temperature. (The system water temperature must be greater than the total of the leaving water temperature setpoint plus one-half the control band before the MicroTech II controller will stage on cooling.)
4. Set the Evap Delta T and the Start Delta T as a starting point.
5. Put both pumpdown switches (PS1 and PS2) to the ON position.
6. Put system switch (S1) to ON position.

Switch	Switch Position	
	ON	OFF
PS1, PS2, Pumpdown Switches	Circuits will operate in the normal automatic mode	Circuit will go through the normal pumpdown cycle and shut off.
S1, System Switch	Unit will operate in the normal automatic mode	Unit will shut off immediately without pumping down (emergency stop)

7. There may be a delay of 2 minutes after closing S1. The time delay is due to the compressor inherent motor protection or the Stage Up Timer counting. This should only occur on initial start-up or when power to the chiller has been turned off and back on. More than one compressor will not start at the same time.
8. After the chiller has been operating for a period of time and has become stable, check the following:
   - Compressor oil level. (Some scroll compressors do not have oil sight glasses.)
   - Refrigerant sight glass for flashing
   - Rotation of condenser fans
9. Complete the "Compressorized Equipment Warranty Form".

Shutdown

Temporary

1. Put both circuit switches to the OFF position (Pumpdown and Stop).
2. After compressors have stopped, put System Switch (S1) to OFF (emergency stop).
3. Turn off chilled water pump. Chilled water pump to operate while compressors are pumping down.

To start the chiller after a temporary shutdown, follow the start-up instructions.

Extended

1. Front seat both condenser liquid line service valves.
2. Put both circuit switches to the OFF position (Pumpdown and Stop position).
3. After the compressors have stopped, put System Switch (S1) to the OFF position (emergency stop).
4. Front seat both refrigerant circuit discharge valves (if applicable).
5. If chilled water system is not drained, maintain power to the evaporator heater to prevent freezing. Maintain heat tracing on the chilled water lines.
6. Drain evaporator and water piping to prevent freezing.
7. If electrical power to the unit is on, the compressor crankcase heaters will keep the liquid refrigerant out of the compressor oil. This will minimize start-up time when putting the unit back into service. The evaporator heater will be able to function.
8. If electrical power is off, make provisions to power the evaporator heater (if chilled water system is not drained). Tag all opened electrical disconnect switches to warn against start-up before the refrigerant valves are in the correct operating position. At start-up, electrical power must be on for 24 hours before starting the chiller.

To start the chiller after an extended shutdown, follow the prestart-up and start-up instructions.

Water Piping Checkout

1. Check the pump operation and vent all air from the system.
2. Circulate evaporator water, checking for proper system pressure and evaporator pressure drop. Compare the pressure drop to the evaporator water pressure drop curve.
3. Clean all water strainers before placing the chiller into service.

Refrigerant Piping Checkout

1. Check all exposed brazed joints for evidence of leaks. Joints may have been damaged during shipping or when the unit was installed.
2. Check that all refrigerant valves are either opened or closed as required for proper operation of the chiller.
3. A thorough leak test must be done using an approved electronic leak detector. Check all valve stem packing for leaks. Replace all refrigerant valve caps and tighten.
4. Check all refrigerant lines to insure that they will not vibrate against each other or against other chiller components and are properly supported.
5. Check all flare connections and all refrigerant threaded connectors.
6. Look for any signs of refrigerant leaks around the condenser coils and for damage during shipping or installation.

7. Leak detector is applied externally to refrigerant joints at the factory. Do not confuse this residue with an oil leak.
8. Connect refrigerant service gauges to each refrigerant circuit before starting unit.

Electrical Check Out

CAUTION

Electrical power must be applied to the compressor crankcase heaters 24 hours before starting unit to drive off refrigerant from the oil.

1. Open all electrical disconnects and check all power wiring connections. Start at the power block and check all connections through all components to and including the compressor terminals. These should be checked again after 3 months of operation and at least yearly thereafter.
2. Check all control wiring by pulling on the wire at the spade connections and tighten all screw connections. Check plug-in relays for proper seating and to insure retaining clips are installed.
3. Put System Switch (S1) to the Emergency Stop position.
4. Put both circuit #1 & #2 switches to the Pumpdown and Stop position.
5. Apply power to the unit. The panel Alarm Light will stay on until S1 is closed. Ignore the Alarm Light for the check out period. If you have the optional Alarm Bell, you may wish to disconnect it.
6. Check at the power block or disconnect for the proper voltage and proper voltage between phases. Check power for proper phasing using a phase sequence meter before starting unit.
7. Check for 120Vac at the optional control transformer and at TB-2 terminal #1 and the neutral block (NB).
8. Check between TB-2 terminal #7 and NB for 120Vac supply for transformer #2.
9. Check between TB-2 terminal #2 and NB for 120Vac control voltage. This supplies the compressor crank case heaters.
10. Check between TB-3 terminal #17 and #27 for 24Vac control voltage.

Operation

Hot Gas Bypass (Optional)

This option allows the system to operate at lower loads without the ON-OFF cycling of the compressor. When the hot gas bypass option is used, it is required to be on both refrigerant circuits because of the lead / lag feature of the controller.

This option allows passage of discharge gas into the evaporator inlet (between the TX valve and the evaporator) which generates a false load to supplement the actual chilled water load.

Note: The hot gas bypass valve cannot be used to generate a 100% false load.

The valve that is supplied can provide a load of approximately 10 tons. The system load added to the ten tons of the hot gas bypass valve has to exceed the compressor capacity for stage 1 compressors for stable system operation. This requires 3-6 tons of system load.

A solenoid valve in the hot gas bypass lines is wired in parallel with both circuit's liquid line solenoid valves SV1 and SV2. The hot gas bypass is available whenever a refrigerant circuit is operating and regulates the evaporator pressure. The pressure regulating valve is factory set to begin opening at 58 psig (32°F for R-22).

⚠ WARNING
The hot gas line may become hot enough to cause injury.
Be careful during valve checkout.

VFD Low Ambient Control (Optional)

The optional VFD fan control is used for unit operation below 35°F (2°C) down to a minimum of 0°F (-17°C). The control looks at the saturated discharge temperature and varies the fan speed to hold the temperature (pressure)) at the "target" temperature. This temperature is established as an input to a setpoint screen labeled "Sat Condenser Temp Target".

Filter-Driers

Each refrigerant circuit is furnished with a full flow filter drier (AGZ 026 – 070) or a replaceable core type filter-drier (AGZ 075 – 130). The core assembly of the replaceable core drier consists of a filter core held tightly in the shell in a manner that allows full flow without bypass.

Pressure drop across the filter drier at full load conditions must not exceed 10 psig at full load. See page 98 for maximum pressure drop at other load points. Replace the filter drier if the pressure drop exceeds maximum.

⚠ WARNING
Pump out refrigerant before removing end flange for replacement of core(s) to remove liquid refrigerant and lower pressure to prevent accidental blow off of cover. EPA recovery regulations apply to this procedure.

A condenser liquid line service valve is provided for isolating the charge in the condenser, but also serves as the point from which the liquid line can be pumped out. With the line free of refrigerant, the filter-drier core(s) can be easily replaced.

System Adjustment

To maintain peak performance at full load operation, the system superheat and liquid subcooling may require adjustment. Read the following subsections closely to determine if adjustment is required.

Liquid Line Sight Glass

The color of the moisture indicator is an indication of the dryness of the system and is extremely important when the system has been serviced. Immediately after the system has been opened for service, the element may indicate a wet condition. It is recommended that the equipment operate for about 12 hours to allow the system to reach equilibrium before deciding if the system requires a change of drier cores.

Bubbles in the sight glass at constant full load indicates a shortage of refrigerant, a plugged filter-drier, or a restriction in the liquid line. However, it is not unusual to see bubbles in the sight glass during changing load conditions.

Refrigerant Charging

Liquid line subcooling at the liquid shut-off valve should be between 15 and 20 degrees F at full load. If the unit is at steady full load operation and bubbles are visible in the sight glass, then check liquid subcooling.

Thermostatic Expansion Valve

The expansion valve performs one specific function. It keeps the evaporator supplied with the proper amount of refrigerant to satisfy the load conditions.

The sensing bulb of the expansion valve is installed in the closest straight run of suction line from the evaporator. The bulb is held on by clamps around the suction line and is insulated to reduce the effect of surrounding ambient temperatures. In case the bulb must be removed, simply slit the insulation on each side of the bulb, remove the clamps and then remove the capillary tubing that runs along the suction line from the valve. The power element is removable from the valve body.

NOTE: Before adjusting superheat, check that unit charge is correct and liquid line sight glass is full with no bubbles and that the circuit is operating under stable, full load conditions.

The suction superheat for the suction leaving the evaporator is set at the factory for 8 to 12 degrees F at full load. To have full rated unit performance, the superheat must be about 8 degrees F at 95°F outdoor ambient temperature.

Crankcase Heaters

The scroll compressors are equipped with externally mounted band heaters located at the oil sump level. The function of the heater is to keep the temperature in the crankcase high enough to prevent refrigerant from migrating to the crankcase and condensing in the oil during off-cycle.

Power must be supplied to the heaters 24 hours before starting the compressors.

Evaporator

Models AGZ 026 through 070

The evaporator is a compact, high efficiency, single or dual circuit, brazed plate-to-plate type heat exchanger consisting of parallel stainless steel plates.

The evaporator is protected with an electric resistance heater and insulated with 3/4" (19mm) thick closed-cell polyurethane insulation. This combination provides freeze protection down to -20°F (-29°C) ambient air temperature.

The water side working pressure is 363 psig (2503 kPa). Evaporators are designed and constructed according to, and listed by, Underwriters Laboratories (UL).

Models AGZ 075 through 130

The evaporator is direct expansion, shell-and-tube type with water flowing in the baffled shell side and refrigerant flowing through the tubes. Two independent refrigerant circuits within the evaporator serve the unit's dual refrigerant circuits.

The evaporator is wrapped with an electric resistance heater cable and insulated with 3/4" (19mm) thick vinyl nitrate polymer sheet insulation, protecting against water freeze-up at ambient air temperatures to -20°F (-29°C). An ambient air thermostat controls the heater cable. The fitted and glued-in-place insulation has a K factor of 0.28 Btu in/hr ft^2 °F at 75°F.

The refrigerant (tube) side maximum working pressure is 300 psig (2068 kPa). The water side working pressure is 152 psig (1048 kPa). Each evaporator is designed, constructed, inspected, and stamped according to the requirements of the ASME Boiler and Pressure Vessel Code. Double thickness insulation is available as an option.

Unit Maintenance

General

On initial start-up and periodically during operation, it will be necessary to perform certain routine service checks. Among these are checking the liquid line sight glasses, taking condensing and suction pressure readings, and checking to see that the unit has normal superheat and subcooling readings. A recommended maintenance schedule is located at the end of this section.

Compressor Maintenance

The scroll compressors are fully hermetic and require no maintenance other than checking oil level.

Lubrication

No routine lubrication is required on AGZ units. The fan motor bearings are permanently lubricated and no further lubrication is required. Excessive fan motor bearing noise is an indication of a potential bearing failure.

Compressor oil should be standard refrigeration mineral oil such as Suniso 3GS.

Electrical Terminals

⚠ WARNING

Electric shock hazard. Turn off all power before continuing with following service.

Condensers

The condensers are air-cooled and constructed of 3/8" (9.5mm) O.D. internally finned copper tubes bonded in a staggered pattern into louvered aluminum fins. Maintenance consists primarily of the routine removal of dirt and debris from the outside surface of the fins and repairing any fin damage. McQuay recommends the use of foaming coil cleaners available at most air conditioning supply outlets. Use caution when applying such cleaners as they can contain potentially harmful chemicals. Care should be taken not to damage the fins during cleaning. The coils should be thoroughly rinsed to remove any cleaner residue.

If the service technician determines that the refrigerant circuit contains noncondensables, recovery can be required, strictly following Clean Air Act regulations governing refrigerant discharge to the atmosphere. The Schrader purge valve is located on the vertical coil headers on both sides of the unit at the end opposite the control box. Decorative panels cover the condenser coils and must be removed for servicing. Recover with the unit off, after a shutdown of 15 minutes or longer, to allow air to collect at the top of the coil. Restart and run the unit for a brief period. If necessary, shut the unit off and repeat the procedure. Follow accepted environmentally sound practices when removing refrigerant from the unit.

Optional High Ambient Control Panel

Consists of exhaust fan with rain hood, two inlet screens with filters, necessary controls and wiring to allow operation to 125°F (52°C). The option can be factory or field installed as a kit. Must be used for:

- Ambient temperatures above 105°F (40°C) with fan VFD (low ambient option).
- Ambient temperatures above 115°F (46°C) with standard FanTrol control.
- Check inlet filters periodically and clean as required. Verify that the fan is operational.

Liquid Line Sight Glass

The refrigerant sight glasses should be observed periodically. (A weekly observation should be adequate.) A clear glass of liquid indicates that there is subcooled refrigerant charge in the system. Bubbling refrigerant in the sight glass, during stable run conditions, indicates that the system can be short of refrigerant charge. Refrigerant gas flashing in the sight glass could also indicate an excessive pressure drop in the liquid line, possibly due to a clogged filter-drier or a restriction elsewhere in the liquid line. See Table 45 for maximum allowable pressure drops. If subcooling is low, add charge to clear the sight glass. If subcooling is normal (15 to 20 degrees F) and flashing is visible in the sight glass, check the pressure drop across the filter-drier. Subcooling should be checked at full load with 70°F (21.1°C) outdoor air temperature, stable conditions, and all fans running.

An element inside the sight glass indicates the moisture condition corresponding to a given element color. If the sight glass does not indicate a dry condition after about 12 hours of operation, the circuit should be pumped down and the filter-drier changed or verify moisture content by performing an acid test on the compressor oil.

Preventive Maintenance Schedule

OPERATION	WEEKLY	MONTHLY (Note 1)	ANNUAL (Note 2)
General			
Complete unit log and review (Note 3)	X		
Visually inspect unit for loose or damaged components		X	
Inspect thermal insulation for integrity			X
Clean and paint as required			X
Electrical			
Check terminals for tightness, tighten as necessary			X
Clean control panel interior			X
Visually inspect components for signs of overheating		X	
Verify compressor heater operation		X	
Test and calibrate equipment protection and operating controls			X
Megger compressor motor *			X
Refrigeration			
Leak test		X	
Check sight glasses for clear flow	X		
Check filter-drier pressure drop (see manual for spec)		X	
Perform compressor vibration test			X
Acid test oil sample			X
Condenser (air-cooled)			
Clean condenser coils (Note 4)			X
Check fan blades for tightness on shaft (Note 5)			X
Check fans for loose rivets and cracks			X
Check coil fins for damage			X

Notes:

1. Monthly operations include all weekly operations.
2. Annual (or spring start-up) operations includes all weekly and monthly operations.
3. Log readings can be taken daily for a higher level of unit observation.
4. Coil cleaning can be required more frequently in areas with a high level of airborne particles.
5. Be sure fan motors are electrically locked out.

*** Never Megger motors while they are in a vacuum.**

WARNING

Service on this equipment is to be performed by qualified refrigeration personnel familiar with equipment operation, maintenance, correct servicing procedures, and the safety hazards inherent in this work. Causes for repeated tripping of equipment protection controls must be investigated and corrected.
Disconnect all power before doing any service inside the unit.
Anyone servicing this equipment shall comply with the requirements set forth by the EPA in regards to refrigerant reclamation and venting.

Filter-Driers

A replacement of the filter-drier is recommended any time excessive pressure drop is read across the filter-drier and/or when bubbles occur in the sight glass with normal subcooling. The maximum recommended pressure drops across the filter-drier are as follows:

Table 45, Filter-Drier Pressure Drop

PERCENT CIRCUIT LOADING (%)	MAXIMUM RECOMMENDED PRESSURE DROP ACROSS FILTER DRIER PSIG (KPA)
100%	10 (69)
75%	8 (55.2)
50%	5 (34.5)
25%	4 (27.6)

The filter-drier should also be changed if the moisture indicating liquid line sight glass indicates excess moisture in the system.

During the first few months of operation the filter-drier replacement can be necessary if the pressure drop across the filter-drier exceeds the values listed in the paragraph above. Any residual particles from the condenser tubing, compressor and miscellaneous components are swept by the refrigerant into the liquid line and are caught by the filter-drier.

Liquid Line Solenoid Valve

The liquid line solenoid valves that shut off refrigerant flow in the event of a power failure do not normally require any maintenance. The solenoids can, however, require replacement of the solenoid coil or of the entire valve assembly.

The solenoid coil can be checked to see that the stem is magnetized when energized by touching a screwdriver to the top of the stem. If there is no magnetization, either the coil is bad or there is no power to the coil.

The solenoid coil can be removed from the valve body without opening the refrigerant piping after pumpdown. For personal safety, shut off and lock out the unit power.

The coil can then be removed from the valve body by simply removing a nut or snap-ring located at the top of the coil. The coil can then be slipped off its mounting stud for replacement.

To replace the entire solenoid valve follow the steps involved when changing a filter-drier.

Evaporator

The evaporators are the direct expansion, shell-and-tube type with refrigerant flowing through the tubes and water flowing through the shell over the tubes or stainless steel brazed-plate type. The tubes are internally finned to provide extended surface as well as turbulent flow of refrigeration through the tubes. Other than cleaning and testing, no service work should be required on the evaporator.

Refrigerant Charging

AGZ air-cooled chillers are shipped factory charged with a full operating charge of refrigerant but there can be times that a unit must be recharged at the job site. Follow these recommendations when field charging. Refer to the unit operating charge found in the Physical Data Tables.

Unit charging can be done at any steady load condition (preferably at 75 to 100% load) and at any outdoor temperature (preferably higher than 70°F (21.1°C). Unit must be allowed to run 5 minutes or longer so that the condenser fan staging is stabilized at normal operating discharge pressure. For best results, charge with two or more condenser fans operating on each refrigerant circuit.

The AGZ units have a condenser coil design with approximately 15% of the coil tubes located in a subcooler section of the coil to achieve liquid cooling to within 5°F (3°C) of the outdoor air temperature when all condenser fans are operating. This is equal to 15°F to 20°F (8.3°C to 11.1°C) subcooling below the saturated condensing temperature when the pressure is read at the liquid valve between the condenser coil and the liquid line filter-drier. Once the subcooler is filled, extra charge will not lower the liquid temperature and does not help system capacity or efficiency.

One of the following three scenarios will be experienced with an undercharged unit:

1. If the unit is slightly undercharged, the unit will show bubbles in the sight glass. Recharge the unit as described in the charging procedure below.
2. If the unit is moderately undercharged, it will normally trip on freeze protection. Recharge the unit as described in the charging procedure below. However, freezestat trips can also be an indication of low flow or poor heat transfer due to tube fouling. Anti-freeze solutions can also cause freezestat trips.
3. If the unit is severely undercharged, the unit will trip due to lack of liquid flow to the expansion valve. In this case either remove the remaining charge by means of a proper reclamation system and recharge the unit with the proper amount of refrigerant as stamped on the unit nameplate, or add refrigerant through the suction valve on the compressor. If the unit is severely undercharged, the unit can nuisance trip during this charging procedure. If this happens, operate the unit at minimum load, adding charge until the sight glass is clear. Once the unit has enough charge so that it does not trip out, continue with step 2 of the charging procedure below.

Procedure to charge a moderately undercharged AGZ unit:

1. If a unit is low on refrigerant, you must first determine the cause before attempting to recharge the unit. Locate and repair any refrigerant leak. Evidence of oil is a good indicator of leakage, however, oil may not be visible at all leaks. Liquid leak detector fluids work well to show bubbles at medium size leaks but electronic leak detectors can be needed to locate small leaks.
2. Add the charge to the system through the suction shutoff valve or through the Schrader fitting on the tube entering the evaporator between the compressor and the evaporator head.
3. The charge can be added at any load condition between 25-100% load per circuit but at least two fans should be operating per refrigerant circuit, if possible. The suction superheat should be in the 8 to 12 degree F (4.4°C-6.6°C) range.
4. Add sufficient charge to clear the liquid line sight glass and until all flashing stops in the sight glass.
5. Check the unit subcooling value by reading the liquid line pressure and temperature at the liquid line near the filter-drier. The subcooling values should be between 15 and 20 degrees F (8.3 and 11.1 degrees C).
6. With outdoor temperatures above 60°F (15.6°C), all condenser fans should be operating and the liquid line temperature should be within 5°F to 10°F (2.8°C to 5.6°C) of the outdoor air temperature. At 25-50% load, the liquid line temperature should be within 5°F (2.8°C) of outdoor air temperature with all fans on. At 75-100% load the liquid line temperature should be within 10°F (5.6°C) of outdoor air temperature with all fans on.
7. Overcharging of refrigerant will raise the compressor discharge pressure due to filling of the condenser tubes with excess refrigerant.

Warranty Statement

Limited Warranty

Consult your local McQuay Representative for warranty details. Refer to Form 933-43285Y. To find your local McQuay Representative, go to www.mcquay.com.

AGZ Troubleshooting Chart

PROBLEM	POSSIBLE CAUSES	POSSIBLE CORRECTIVE STEPS
Compressor Will Not Run	1. Main switch. 2. Fuse blown. circuit breakers open 3. Thermal overloads tripped 4. Defective contactor or coil. 5. System shutdown by equipment protection devices 6. No cooling required 7. Liquid line solenoid will not open 8. Motor electrical trouble 9. Loose wiring	1. Close switch. 2. Check electrical circuits and motor windings for shorts or grounds. Investigate for possible overloading. Replace fuse or reset breakers after fault is corrected. Check for loose or corroded connections. 3. Overloads are auto-reset. Check unit closely when unit comes back on line. Allow time for auto-reset. 4. Repair or replace 5. Determine type and cause of shutdown and correct it before resetting equipment protection switch. 6. None. Wait until unit calls for cooling. 7. Repair or replace solenoid coil. Check wiring. 8. Check motor for opens, shorts, or burnout. 9. Check all wire junctions. Tighten all terminal screws.
Compressor Noisy Or Vibrating	1. Low or no refrigerant charge 2. Compressor running in reverse 3. Improper piping support on suction or discharge 4. Worn compressor isolator bushing 5. Worn Compressor	1. Repair and recharge 2. Check unit and compressor for correct phasing 3. Relocate, add, or remove hangers 4. Replace 5. Replace
High Discharge Pressure	1. Noncondensables in system 2. System overcharged with refrigerant 3. Optional discharge shutoff valve partially closed 4. FanTrol wiring not correct 5. Fan not running 6. Dirty condenser coil 7. Air recirculation	1. Extract the noncondensables with approved procedures. 2. Remove excess, check liquid subcooling. 3. Open valve. 4. Check FanTrol wiring. 5. Check electrical circuit, Check fan motor. 6. Clean coil. 7. Correct.
Low Discharge Pressure	1. Refrigerant flood back 2. Wind blowing into coil at low ambient 3. Faulty condenser temperature regulation 4. Insufficient refrigerant in system 5. Low suction pressure 6. Only one compressor operating	1. Correct. 2. Shield coil from direct wind, Wind guards are available. 3. Check condenser control operation. 4. Check for leaks. Repair and add charge. 5. See corrective steps for Low Suction Pressure. 6. See corrective steps for Compressor Will Not Stage Up.
High Suction Pressure	1. Excessive water temperature 2. Excessive load 3. Expansion valve overfeeding 4. Compressors running in reverse	1. Check control settings. 2. Reduce load or add additional equipment. 3. Check remote bulb. Regulate superheat. 4. Check for proper phasing.
Low Suction Pressure	1. Rapid load swings 2. Lack of refrigerant 3. Clogged liquid line filter drier 4. Expansion valve malfunctioning 5. Condensing temperature too low 6. Compressor will not unload 7. Insufficient water flow 8. Evaporator head ring gasket slippage 9. Evaporator dirty 10. Rapid load swings	1. Stabilize load. 2. Check for leaks, repair, add charge. Check liquid sight glass. 3. Check pressure drop across filter drier. Replace. 4. Check and reset for proper superheat. 5. Check means for regulating condenser temperature. 6. See corrective steps for Compressor Staging Intervals Too Low. 7. Adjust flow. 8. Take pressure drop across vessel and contact factory to obtain design pressure drop for that vessel. 9. Clean chemically. 10. Stabilize load.
Compressor Will Not Stage Up	1. Defective capacity control 2. Faulty thermostat stage or broken wire 3. Stages not set for application	1. Replace. 2. Replace. 3. Reset thermostat setting for application.
Compressor Staging Intervals Too Short	1. Thermostat control band not set properly 2. Faulty water temperature sensor 3. Insufficient water flow 4. Rapid load swings	1. Set control band wider. 2. Replace. 3. Adjust flow. 4. Stabilize load.

Table continued on next page.

PROBLEM	POSSIBLE CAUSES	POSSIBLE CORRECTIVE STEPS
Compressor Oil Level Too High Or Too Low	1. Oil hang-up in piping 2. Low oil level 3. Loose fitting on oil line 4. Level too high 5. Insufficient water flow - Level too high 6. Excessive liquid in crankcase - Level too high 7. Short cycling	1. Review refrigerant piping and correct. 2. Check and add oil. 3. Check and tighten system. 4. Adjust thermal expansion valve. 5. Adjust flow. 6. Check crankcase heater. Reset expansion valve for higher superheat. Check liquid line solenoid valve operation. 7. Stabilize load or increase staging interval.
Compressor Loses Oil	1. Lack of refrigerant 2. Suction superheat too high 3. Crankcase heater burnout	1. Check for leaks and repair. Add refrigerant 2. Adjust superheat. 3. Replace crankcase heater.
Motor Overload Relays or Circuit Breakers Open	1. Low voltage during high load conditions 2. Defective or grounded wiring in motor 3. Loose power wiring or burnt contactors 4. High condenser temperature 5. Power line fault causing unbalanced voltage	1. Check supply voltage for excessive line drop. 2. Replace compressor motor. 3. Check all connections and tighten. 4. See corrective steps for High Discharge Pressure. 5. Check supply voltage. Notify power company. Do not start until fault is corrected..
Compressor Thermal Protection Switch Open	1. Operating beyond design conditions 2. Discharge valve partially shut 3. Blown compressor internal gasket 4. Voltage range or imbalance 5. High superheat 6. Compressor bearing failure	1. Add facilities so conditions are within allowable limits. 2. Open valve. 3. Replace gasket. 4. Check and correct. 5. Adjust to correct superheat. 6. Replace compressor .
